Smith's Patent Wood-working Machinery of all descriptions. Sole Agents, BERRY & PLACE, 112 and 114 California street, San Francisco.

The California Powder Works

No. 314 CALIFORNIA STREET.

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST ELASTIC POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

JOHN F. LOHSE, Secretary.

Ahead of the World.

THE NEW TREADLE POWER,

Just Invented, and used exclusively on the HOWE SEWING MACHINE.

With it any lady, however delicate her health may be, can run the Machine from morning until night with perfect impunity.

The Howe is the Best,

Consequently the most Popular Machine in use. The Daily manufacture is over 500 Machines.

H. A. DEMING, Agent,

ap15-3m No. 113 Kearny street, San Francisco.

Manganese ! Manganese !

We have on hand the Best and Purest article of Powdered Black Oxide of Manganese ever sold on this coast. Price, Sixty Dollars a Ton.

We also offer to consumers

Acids, Sulphate of Copper.

CYANIDE OF POTASS.

And Chemicals of all kinds at Lowest Prices.

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

LORD & PETERS,

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indubitably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility having no cams, nor complex rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroads and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them; we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by BERRY & PLACE, Machinery Depot, 112 and 114 California st., San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

To the Public.

THE PACIFIC STONE COMPANY,

SITUATED AT THE CORNER OF,

Turk and Larkin Streets,

IS NOW IN OPERATION AND MANUFACTURING, UNDER THE Ransom Patents, the most perfect SANDSTONE, specimens of which may be seen in the ornamentation of Dr. Stone's Church, now in course of erection, at the corner of Post and Mason streets. For architectural, ornamental and mechanical purposes, this stone surpasses all natural stone of its class.

GRINDSTONES from this factory, which we make of any desired size, may be seen at many of the great mechanical shops in this city, where they are held in high esteem.

The factory is now turning out Architectural Stone, Cemetery Stone, Grindstones, Garden Ornaments, in the way of Vases, Fountains, etc. The nature of the art admits of our moulding the stones in any desirable form, and enables us to compete successfully with all natural stone wrought by hand. In England, where the stone has been manufactured largely for the past fifteen years, it is considered, for durability and strength, to surpass the best English Sandstone. The British Government employs it largely in its public buildings, both at home and in its Colonies; and as we have secured the services of MR. ERNEST L. RANSOM, late Superintendent of the home works at Greenwich, England, we are turning out stone fully equal to the English standard.

Particulars, apply at the Factory, corner Turk and Larkin streets. mal8-tf.

To Inventors in the Pacific States.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain a Patent,

A well-constructed model is generally first needed, if the invention can well be illustrated. It must not exceed 12 inches in length or height. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it. Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., SCIENTIFIC PRESS OFFICE SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement, describing the various parts and their operations.

Also send \$15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

We do not require the personal attendance of the inventor, unless the invention is one of great complication. Usually the business can be well done by correspondence.

For filing a caveat, which affords the inventor protection for one year, we only require a rough sketch, and a clear description of the invention.

It will cost inventors less to have their business thoroughly and speedily done through our agency than to patronize less able and responsible agents.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS 112 illustrated mechanical movements and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAWS of 1870.

The Eureka Lubricator.

This lubricator, the invention of a gentleman in this city, although of recent date, is coming rapidly into favor on account of the excellent reports of its economy and value given by those who have used it.

The construction is simple. *B* is the steam pipe from the boiler, and *C* the cylinder. The condensing pipe, *A*, (provided with a valve, *L*), admits steam (which it condenses) into the reservoir, *D*, whence, as water, it is allowed to pass into the cup, *F*, below the oil, *X* being the feed valve to regulate its flow. The cup is filled at *N*. The discharge pipe, *E*, conveys the oil to the steam pipe, *B*, being provided with a check valve next to the cup (to keep steam out of the cup), and with a valve, *G*, to shut off the supply of oil when the engine is stopped. The principle is that the condensing pipe being above the discharge pipe and containing a column of water, there is a pressure to force the oil out of the cup into the steam pipe. There is thus obtained a constant oiling, the amount being regulated by the proper valves.

This supply is not left to be guessed at. Attached to, and connecting with, the cup, *F*, is a glass tube, *J*, so that the amount of oil in the cup is seen. *P* and *H* are stop cocks, and *O* is a cock to clean the tube. Attached to this tube is a sliding gauge, *K*, by means of which the amount of oil consumed is shown.

There is nothing which passes the feed valve except pure, condensed water, which is forced under the oil by the pressure of the column of water in the condensing pipe; this allows the oil to flow out of the discharge pipe of its own accord, without the oil itself being regulated. The condensed water will not choke the valve, and will pass through a very fine opening for a long time, and thus the choking up of the passages, which occurs with oil or tallow, is avoided. When the oil is introduced into the steam pipe, it is converted into greasy steam, and as it is fed constantly, but little is required. The engineer, by means of the tube, *J*, and gauge, *K*, sees just how much oil is in the cup, and how fast it is being used. Thus he is enabled to have full control of the oil and to economize in material, in the wear and tear of the engine, and in his time and labor.

The lubricator is suitable for any engine. The cup may be placed in any convenient place. The oil should be discharged, in all cases, in the steam pipe above the valves.

The perpendicular pipe in the reservoir must be not less than ten inches above the discharge pipe, and as much higher as convenient. When too high, it requires the feed too fine; and when too low, there is not pressure enough to force the oil out of the cup. It takes three inches of water above the check-valve to balance it. The best height is one foot above the reservoir.

It was patented February 14th, 1871, by Mr. N. Seibert, whom address care California Brass Works, 125 First street, San Francisco.

Mechanics' Institute—Eighth Industrial Exhibition.

The Board of Managers are really making surprising efforts. In addition to what

Drawing; Still Life Drawing; Maps. The pupils who may compete, will be divided into three grades, ages being as follows: Grade A,—boys, 18 to 16 years; girls, 16 to 14 years. Grade B,—boys, 16 to 14; girls, 14 to 12. Grade C,—boys, 14 years and under; girls, 12 years and under. It appears from this that the boys are given the advantage of two years in age, which, although said to be the usual thing, we cannot really see the fairness of. A first (silver medal) and second premium (bronze medal) will be awarded to each class and grade. The classification does not include oil or water color.

In addition, the following premiums will be awarded by the Mechanics' Institute to regular attendants of Evening Public Schools: A set of drawing instruments (worth \$75) and \$50 in coin (added by the President, Mr. Hallidie) for the best architectural or mechanical drawing from a design or model, not a copy of a drawing; silver medal for best and bronze medal for second best mechanical drawing; do. for architectural drawing. Notice of intention to compete in all the above cases to be given before July 25th, and drawings to be in position before August 8th.

We hope the boys and girls will enter in strong numbers into the competitive lists. The collection of drawings will certainly be not the least interesting one of the Exhibition. In conclusion, we cannot refrain from again complimenting the Board of Managers for their most praiseworthy efforts to make the coming Exhibition a complete one in all respects.

PATENT TO A PLACER MINING CLAIM.—The first patent, perhaps, that has been issued to a placer mining claim under the act of July 9th, 1870, says the Sacramento Union, was received by the Register of the United States Land Office at Sacramento, on the 13th ult. This patent was received in exactly seven months from the date of the notice of intention to apply for a patent, which, having been published three months, and in view of the forms necessary to put the law in operation, shows considerable dispatch. It is to be hoped, however, that greater dispatch will be found possible hereafter.

STEAMBOAT SPRINGS, NEVADA.—The *Territorial Enterprise*, of April 30th, states that, according to information received, a surprising change had occurred at Steamboat Springs. The springs had suddenly dried up, and no steam or water was issuing as before. The statement, if true, is most interesting and important.

SEIBERT'S PATENT EUREKA LUBRICATOR.

Lard, castor, sea elephant and walrus oils are the best for use.

We need not dilate on the advantage of oiling constantly and on the other points of this lubricator. It has been in use in this city and elsewhere, in establishments of various kinds, gives the best of satisfaction, and saves, by a table given us, all the way from \$5 to \$39 per month in oil, to say nothing of other respects, over the cups

we have already noted, we learn from a circular, received this week, that the boys and girls are not to be forgotten. With a view to promote the study of drawing in the public schools, they now offer thirty-six silver and bronze medals to be competed for by the school children, for drawings which are divided into six classes, viz.: Mechanical Drawings and Designs; Architectural do.; Landscape Drawing; Marine

ever, that greater dispatch will be found possible hereafter.

MECHANICAL PROGRESS.

EFFECT OF THE COAL TROUBLE.—The following is from the argument of President Gowen of the Reading Railroad Co. before the Judiciary Committee of the Pennsylvania Legislature:—"The effect on the coal trade has resulted in a diversion of at least 2,000,000 tons of coal per annum from the anthracite trade, which it will never recover. Upon the iron trade the effect has been such as to seriously threaten the removal of the whole iron producing interest from Eastern Pennsylvania to the South and West. No better protection can be offered the English iron trade than the action of the Workmen's Benevolent Association. In the last sixty days more orders have left the country for Scotch Pig Iron than were sent in all last year. The effects upon the men themselves are even more disastrous."

The Iron Age of April 27th has the following:—"The effects of the strike in the anthracite coal regions are becoming quite serious. A dispatch from Scranton says: Thirty four blast furnaces have been compelled to suspend operations between Mauch Chunk and New York. One of the two furnaces of the L. I. and C. Co., in this city, has already blown out, and the other is now going out of blast, while the fires of the great rolling mills, too, have gone out. Silence and desolation now reign where but a few days ago all was industry and prosperity. Scores of the busy, industrious iron workers, who see no prospect in the future, are already leaving, while many others are preparing to leave as soon as possible. Thirteen hundred additional workmen are thus thrown out of employment."

THE FLUO-TITANIC PROCESS.—Prof. C. P. Williams, in the *American Exchange and Review* for April, thus remarks upon this steel-making process: "It consists essentially in mixing powdered titaniferous iron ore with calcic-fluoride (fluor spar), and charging this mixture upon the sole of the furnace. Gray pig-iron being then added, reactions are set up between the fluor spar and the titaniferous ore on the one hand, and the silicon, carbon, sulphur and phosphorus of the pig-iron on the other. The silicon is removed at an early stage of the process—at least such are stated to be the indications of rigid chemical analyses—and the carbon is changed from the graphitic into the combined form. Now, as it is claimed by some metallurgists that sulphur and phosphorus cannot be removed till all the silicon has become eliminated, and as the reaction of fluorine is always in this latter direction, it would seem that the practical realization of the long-desired production of sulphur and phosphorus free iron was at length to be brought about by the employment of areagent which, though not new to metallurgy, is certainly a novelty in the iron furnace. The old oxygen method of removing silicon is in this process combined with, in this respect, the still more powerful fluorine reactions. There is this further advantage, that, in the earlier stages of the new process, there is no waste of the iron scoriification, "as the silicon and phosphorus pass off in the form of vapor, and the only loss of weight attending the operation at this period is the weight of the silicon and phosphorus. Experiments made with the new process in crucibles, to produce steel and wrought iron (at temperatures 1,000° higher than in the puddling furnace used for the large experiments), have yielded considerably greater weight of wrought-iron than the weight of the pig-iron used. These gains are due to the reduction of the iron, in the oxide to the metallic state, and its incorporation with the rest of the metal."

IRON SHIP-BUILDING IN AMERICA.—"On April 15, there was launched from the yard of the Pennsylvania Iron Works, at Chester, Pa., an iron screw steamer, the City of Houston, of 1,600 tons burthen, designed for traffic between New York City and Galveston. It is claimed for this vessel that in strength, beauty of model, and finish of workmanship she cannot be excelled by any of her class and tonnage afloat. Her length on deck is 228 feet; breadth of beam, 33 feet; and depth of hold, 21 feet; and she has an estimated light-load draught of less than 8 feet. Her machinery will be driven by a single overhead engine, with a 48-inch cylinder and 4 feet stroke of piston. The surface condenser contains 2,130 5-8ths tubes of 4 feet length. The boilers are two, of the return flue variety, and together have a heating

surface of 4,532 square feet. The propeller has a diameter of 13 feet. Although not of the largest size, this vessel, in its successful building in one of our own yards, shows, as others have done before it, that first-class work at paying rates can be done even under the discouraging conditions that now attend American ship-building."—*Am. Artisan*, April 26th.

INDIA RUBBER SPONGE.—The *Manufacturer and Builder* for May describes the new article made in New York:—"To render the rubber porous, some substance like sugar, common salt, or other solid soluble in water is mixed with the gum before vulcanization, the quantity, of course, determining the grade of the sponge. Each particle of the sugar or salt is, of course, enveloped more or less in a film of rubber. By proper working by the usual rolls and rubber-mixing machines, the whole forms a perfectly solid mass. It then goes to the vulcanizing oven, where the proper heating is given. The mass comes from the oven perfectly solid, and no more porous than an ordinary rubber spring. The salt or sugar is then removed by washing and kneading, which leaves the rubber in the form of a sponge. The porous condition produced in this manner differs very much from that produced by the alum or carbonic acid process. In the latter, there is a constant tendency to produce little balloons of rubber, with walls extremely thin. In the former process the cells are in free communication with each other, the material appearing more in the form of threads, grains, and perforated walls, with free passages in all directions. This remarkable product has the property of retaining heat to a great degree. For applications of hot water, it can be used in any position. It being free from grit, it can be used for the most delicate purposes—for the toilet and the bath, for cleaning carriages, for hat brushes, for cleaning kid gloves, pictures, or drawings, for lithographer's use, and for all purposes for which the natural sponge is used; and, as it can be made of any degree of fineness, any form, size, or color, and is unaffected by acids, for many purposes where the natural sponge cannot be used."

SPEED ON DIFFERENT RAILWAY GAUGES. The following is clipped from a circular recently published by Baird & Co., of the Baldwin Locomotive Works, Phila., and condensed by the *Chicago Railway Review*. "A narrow gauge locomotive with driving wheels 36 in. diam. and cylinders with 16 in. stroke, at 36 m. per hour, develops the same speed of piston as a full gauge loco. with 5 ft. driving wheels, and cylinders 24 in. stroke, at 40 m. per hour. With driving wheels 40 in. diam. and 16 in. stroke of piston, the narrow gauge locomotive develops the same total travel of piston per mile as does the full gauge locom. with driving wheels 60 in. diam. and 24 in. stroke. Equal speeds are therefore attainable on the narrow and the full gauge. The angle of stability of the narrow gauge loco. with 3 ft. driving wheel is somewhat greater than that of the 4 ft. 8½ gauge locomotive with 5 ft. driving wheel."

A PRETTY CONCEIT AND PRACTICAL HINT. A curious and beautiful effect was produced by one of the ice-making machines built by J. P. Morris & Co. of Philadelphia, lately, which excited the admiration of all who saw the specimen. This was a cake of manufactured ice, in the centre of which, completely enclosed by the translucent material, was a bouquet of fresh flowers. Every leaf and flower was perfectly visible while the brilliancy of the colors was enhanced by the refraction through the ice. This specimen was produced by the Carre-Ammonia process, under which these machines are operated. It was presented to the Hon. Marshall P. Wilder of Boston, who had delivered a lecture upon the fruits and flowers of the Pacific coast, before the Philadelphia Horticultural Society. Beyond the beauty of the spectacle there lies a practical use to which this process may be applied, which will result in the preparation of fruits and provisions for transportation from a distance.—*Iron Age*, April 27th.

ELASTIC IRON RAILWAY TRACK.—Mr. John E. Lowe, of London, has invented an iron sleeper in which elasticity is sought by sustaining the rail on a plate or clip of wrought iron or steel which is cast into the sleeper over a trough-like hollow, and forms an elastic bridge seven or eight inches long, on which the rail rests.—*Railroad Gazette*.

SCIENTIFIC PROGRESS.

THE EOCENE BEDS OF UTAH.—T. A. Conrad contributes a note upon this subject to *Silliman's Journal* for May. We quote:—"I am indebted to Prof. Cope for an opportunity to examine some Eocene fossil shells, collected at Aspen station, and at Quaking Asp Ridge, east of Bear river, Utah, at an elevation of 7,100 feet. These fossils were taken from the rock in which they were imbedded, by Lucius C. Ricksecker, engineer on the Pacific Railroad. * * The fossils are especially interesting in consequence of the light they cast on the condition of the globe in the earliest Eocene period. * * The hydrography of this early Tertiary era may be imagined from the foregoing statement to have been a river system analogous to that of Brazil at the present time. The presence of vast numbers of estuary shells forbids us to suppose that the group inhabited lakes rather than rivers, which rose in not greatly elevated hills, for mountains, except as isolated peaks, had hardly been developed at this period, when the great basin of Utah was submerged, and the Mississippi valley and its rivers were not yet formed, but the general drainage was into the Pacific ocean. There was then a system of great rivers and a densely wooded country eminently fitted for land animals, whose remains I have no doubt are to be found, if they have not been already obtained. The elevation of this vast region to any considerable height took place in the first stage of the Eocene era, and if we are surprised at the great extent of such brackish water rivers, we have only to glance at a similar river system 2,200 miles up the Amazon. By the rise of the Cretaceous formation, this condition of the country was formed, and as no transition beds are known, the advent of new genera and species so different from what had lived before is an unexplained phenomenon in the geological history of the globe. So far in Europe, I believe, no authentic account has been published of any fossiliferous beds between the lower Eocene and the Cretaceous strata, that would indicate a transition period to have intervened. And so in Utah, Idaho and Wyoming, the remarkable condition is apparent, as it is in the Eastern States, in England, France, Spain, India, on the banks of the Nile and in South America, which proves that the revolution which closed the Cretaceous era was co-extensive with the globe and destroyed the life of the period."

LEGS OF THE TRILOBITE.—Prof. Dana, in the May number of the *Am. Journal of Sci. and Arts* describes the specimen belonging to the Canadian Geological Museum, which has been supposed to show remains of legs. On account of the doubts upon the point, it was sent to him for examination, although decided upon in the affirmative by the Geological Society of London. Both Prof. Dana and Prof. Verill carefully considered it, separately and together, and arrived independently at a conclusion in the negative. Their opinion is published at the request of Mr. Billings, of Montreal, the sender of the specimen. We quote briefly:—"The conclusion to which we have come is that the organs are not legs, but the semi-calcified arches in the membrane of the ventral surface to which the foliaceous appendages, or legs, were attached. Just such arches exist in the ventral surface of the abdomen of the Macrura, and to them the abdominal appendages are articulated. This conclusion is sustained by the observation that in one part of the venter three consecutive parallel arches are distinctly connected by the intervening outer membrane of the venter, showing that the arches were plainly in the membrane, as only a calcified portion of it, and were not members moving free above it."

"TIMBRE."—Professor Helmholtz has published a work upon physiological acoustics and the principles of music, which, according to Sedley Taylor,—who notices it in *Nature*,—has practically revolutionized that branch of science. We quote a short paragraph from the notice, in relation to the subject named in the heading of this item:—"He begins by completely clearing up the nature of the quality (timbre) of musical sounds. He

fixes his reader's attention on the harmonics which previous observers had recognised as accompanying a fundamental note. These, he shows, are no isolated phenomena, but invariable concomitants of nearly all musical sounds. In fact, what appears to be a simple note of any assigned instrument, is really a composite sound consisting of a number of different tones, all, however, members of a series connected together by a simple law. The quality of the sound depends on the relative intensities in which these partial-tones are present in the whole mass of sound (Klang) heard. Helmholtz illustrates his theory by determining the relative intensities of the audible partial-tones produced by the principal kinds of musical instruments, and also those corresponding to the different vowel sounds of the human voice. He has also invented an apparatus by which the most important members of the complete series of partial-tones corresponding to a fundamental tone can be sounded with any assigned relative intensities, and which is capable of producing a tolerably close imitation of many sounds differing widely from each other in quality."

SEXUAL SELECTION.—From a second article by Pye-Smith in *Nature* for April 13th, in continuation of his review of Darwin, we copy the following:—"We must admit that, on the whole, birds and other animals admire the same forms and colors which we admire, and this perhaps, may be admitted as an additional argument in favor of their kinship with us. Some of the ugliest creatures (like the hippopotamus) appear to have been quite uninfluenced by sexual selection, while the magnificent plumes of pheasants and birds of paradise are undoubtedly due to its operation. That it has occasionally led to unpleasant results in birds and monkeys of aberrant taste, is no more strange than that all savages do not carve and color as well as the New Zealanders, or that most Englishmen admire ugly buildings and vulgar pictures. The prevailing aspect of nature is hearty, and the prevailing taste of man is for hearty also. The means by which natural hearty has been attained are various. Natural selection is one, by which the healthiest, and therefore the most symmetrical forms survive the rest. Protective mimicry is another, by which fishes have assumed the bright colors of a coral garden and butterflies the delicate venation of leaves. Flowers again have in many cases obtained their gay petals and fantastic shapes from the advantage thus gained for fertilization by insects. The successive steps which have led to the graceful forms and brilliant tints of shells, to the intricate symmetry of an echinospine or a nummulite, these are as yet untraced even in imagination. But that many of the most striking ornaments of the higher animals, and almost all those which are peculiar to one sex, have been developed by means of sexual selection, is a conclusion which can no longer be distrusted. There remain doubtless many exceptions to be accounted for, many modifying influences to be discovered; but the existence of a new principle has been established which has helped to guide the organic world to its present condition. Side by side with the struggle for existence has gone on a rivalry for reproduction, and the survival of the fittest has been tempered by the success of the most attractive."

ALKALI METALS SOLUBLE IN AMMONIA.—It will be recollected that Prof. Chas. A. Seely proved that "ammonium amalgam," so called, is simply a metallic froth of which the liquid part is mercury, and the gaseous part a mixture of hydrogen and ammonia. His attention having been afterwards directed to Weyl's researches and conclusions, he carefully repeated Weyl's experiments, the results being a full confirmation of his own views. An article by him in the *Journal of the Franklin Institute* gives some experiments, the detail of which is preceded by the following remarks:—"This discussion involves the relation of ammonia to the alkali metals, and the results which grow out of that relation. Now, the key to the whole subject is the fact that liquid anhydrous ammonia is a solvent, without definite chemical action, of the alkali metals. I mean that these metals dissolve in the ammonia as salt dissolves in water,—the solid disappears in the liquid, and on evaporating the liquid, the solid reappears in its original form and character. There is no definite atomic action in any such cases; the components of the solution are not changed in their chemical relations to other substances."

CORRESPONDENCE.

Irrigation in Northern Italy.

EDS. PRESS:—In connection with the subject of irrigation, which is now attracting so much attention throughout our State, allow me to send for insertion in your columns an extract from an eminent writer of Great Britain. The result of the extensive system of irrigation in Northern Italy, as described by him, is full of encouragement to those who are ready to organize companies for this purpose in the valleys of California.

By a reference to this extract, and an examination of the map of Lombardy, it will be seen that the only advantage which the valley of the river Po has over Sacramento and San Joaquin valleys, as regards means for irrigation, is the number of lakes along the base of the Alps. These form huge reservoirs which furnish a more abundant supply of water than we can obtain from our streams alone. But it is to be hoped that what water we have, can be employed to such advantage, as to produce results like those described in the following extract.

In reading the description, one is particularly struck with the fact that the fertile soil of Italy is very similar to that of California, as we advance from the base of the mountains towards the rivers and the sea. May the future historian write as glowingly of success in irrigating our own San Joaquin valley, as the writer does here of Italy.

He says: "The whole plain of Lombardy, naturally of great fertility, is rendered still more productive by a system of irrigation more complete, we might almost say more magnificent, than is to be found in any other part of the world. Enclosed between two noble chains of mountains, the Alps to the north and west, the Apennines to the south, the deep and rich soil of this plain seems to have been deposited by an inundation which brought down a portion of the substance of those mountains; consisting, near their bases, of large rounded stones, which gradually diminish in magnitude towards the shores of the Gulf of Venice, where the soil consists entirely of finely-divided matter. To the east of Milan, this plain is covered with pastures of extraordinary richness, from which is brought the celebrated Parmesan cheese. These pastures are regularly flooded. The grass is cut no less than four times in the year; part is made into hay, and part is carried green to the cows, which are kept in stalls.

"In about fifteen years, the herbage, in consequence of this continual watering, becomes too coarse for use; the land is then plowed up, and during five years cropped with wheat, oats, maize, hemp and beans, after which it is again laid down to grass.

"This admirable system of irrigation, which has rendered Northern Italy the most fruitful country, perhaps, in the world, was established in very early times. It was during the flourishing period of the Lombard republics, about the era of our Norman and early Plantagenet kings, while the greater part of Europe remained yet in a state little short of barbarism, that the design was conceived and executed of this great national work. From each of the lakes that occupy the lower declivities of the Alps, and receive the waters of their innumerable springs, issues one principal canal, which, as it descends, is subdivided into a multitude of smaller channels, visiting every district, every farm, and even every individual field, to each of which the water is admitted at pleasure by sluices; and having performed its office, passes off by another cut to the lower land, till it ultimately reaches the Po, which carries off the whole drainage of central Lombardy into the Gulf of Venice. The banks of these canals are mostly planted with willows and alders, over which are frequently seen rows of tall poplars.

"The principal canals belong to the government; the smaller ones are generally the property of individuals, who let or sell the use of the water at so much per hour."

Such is a brief sketch of the system of irrigation in Italy, which has been in operation for more than six hundred years. If they are enabled by this means to cut their hay "four times in the year," may we not

reasonably hope, by perfecting our system of irrigation, to harvest wheat and barley twice a year? Surely similar systems can be made equally successful by the capital, skill and energy of California. w. w. Fairview District, Stanislaus Co.

The Cinchona Tree in California.

The tree from which the Peruvian bark of commerce is obtained, is known by the above name. It is a native of South America, and is found in greatest abundance in Peru—whence its name. From this bark is manufactured quinine, and many other preparations so extensively used in the cure and prevention of diseases peculiar to tropical and miasmatic countries. It is, indeed, in some form the great reliance of the medical profession in the treatment of most all diseases of a malarial origin. There is generally but a faint idea of the great quantity of this bark, and the preparations made from it, used in the world. There were imported into the United States alone within a period of six years ending in 1865, according to the report on commerce and navigation, of bark, 1,631,876 pounds, of the value of \$1,874,112; of all the salts of quinine, 7,525 pounds, of the value of \$287,138; total value, \$2,161,250. In view of the great medical value of the bark, and the probability that the source from which it is obtained will at no distant day be exhausted, different nations have encouraged its cultivation within their own territories.

The English Government, as early as 1859, commenced the cultivation of the Cinchona tree in India, on the Neilgherry mountains, and the effort has been attended with good success. In 1866, the plantation, according to an official report, contains 1,123,645 plants. It has been ascertained by experiment and analysis, that the bark of these trees in India contains the same properties, and in the same degrees, as that from South America. A valuable species of this tree is also found growing naturally on the dry slopes of the Central Cordillera of New Grenada.

The section of country in the Peruvian Andes covered with these trees extends from ten degrees north latitude to twenty degrees south of the equator, at elevations from 6,000 to 11,000 feet, where the average temperature is about 68°. The temperature of the New Grenada district in which it is found, runs all the way from 35° to 60°, and sometimes in the night the temperature goes down to the freezing point.

We have culled the above facts from an able memorial to Congress by the American Medical Association, in which they ask the aid of the general government to establish a plantation of the Cinchona trees in the United States. They especially recommend for such experiment a locality on the western slope of the Sierra Nevada, in California, at an elevation of from 1,500 to 2,000 feet above their base. They say that they believe that all the conditions of climate, which would support the Cinchona, can be found on these mountains at about that elevation. From this memorial we make the following interesting abstract, which, by the way, is one of the most comprehensive and truthful topographical descriptions of California we have ever noticed:

"California covers about 189,000 square miles, between 32° 30' and 42° of north latitude, and is traversed throughout its whole extent by two distinct lines of mountain ranges, while its southeastern limits stretch off towards the 114th degree of west longitude, into the table-lands of New Mexico.

"Sloping back to the first of these mountain ranges is a long line of coast under the control of the ocean—being the only portion of the State preserved from desiccation during the rainless summer, by showers of mist—which has a uniform climate of about 56°, the mean temperature of any one month never exceeding 61°, and never falling below 50°. The extensive region bordering on the great Bay of San Francisco, which seems to adopt one-half of its climatic features from the ocean, and the

other half from the interior and more heated valleys, is inexhaustible in agricultural resources. The Pajaro, and some other valleys further south, to which the oceanic winds gain access through gaps in the Coast Range mountains, belong also to the same system, as well as the Sacramento and San Joaquin valleys, although in a less degree, these latter being further removed from the ocean. The mean temperature of the two last-named valleys is about 60°; while the hottest day is 94°, and the coldest 32°. Next we have the interior mountain region (Sierra Nevada) with innumerable little valleys, buried more or less in snow during the winter, and converted by the summer's sun at midday almost into furnaces, and yet luxuriant with all kinds of delicious fruits. Finally, the southern region, which includes nearly one-fourth of the State, being removed alike from both extremes of temperature which operate, as we have just seen, in the more northern parts, and uninfluenced either by mountain or ocean, enjoys a most genial and equable climate. Moreover, it has been found, practically, that California covers all the zones that belt the earth with climatic differences, for there is scarcely a cereal, fruit, plant, or tree, wheresoever it may be indigenous, that cannot be grown or nurtured in the open air in some part of this State.

"Another remarkable fact connected with the complex atmospheric conditions of California is that the well-known ordinary effects of latitude, longitude, and altitude seem to bear with but comparatively little direct relations in some portions of the State. In the more southerly part of the interior mountain system, the general character of the vegetation has obtained for these mountains the title of the 'Alps of California,' but their analogue is found in the Arctic zone rather than in Switzerland. In the Swiss Alps, trees are not found higher than 6,200 feet above the sea. In the California Alps, trees are found 11,000 feet above the sea, and good pasturage extends from 5,000 to 10,000 feet above the sea level, and even higher—up to the very crests of the peaks. At 3,500 feet above sea level the dense forest begins. The trees are mostly sugar and yellow pine, Douglass spruce, fir, and bastard cedar. Along the western slope, at an altitude of 5,000 to 7,000 feet, the big trees, or giant sequoias, are abundant, not merely occurring in isolated groves, but scattered abundantly in common with the timber for a distance of at least twenty-five miles along the tributaries of Kings, Kawent and Kern rivers.

"Considering, therefore, the peculiarity and variety of the climatic conditions and vegetable productions of California, it can scarcely be doubted that a locality may be found here for the propagation of the Cinchona as readily as in India, where its cultivation has been attended with success."

California Savings Banks vs. California Improvements.

Within the last four or five years past there have been established in nearly all the cities and interior towns of this State, banks for the deposit, safe keeping and loan of money,—generally called Savings Banks. The extent to which these institutions have succeeded in accumulating together the money of the country, both in large and small sums, is truly astonishing. Notwithstanding they have also been very successful in loaning out large and truly astonishing amounts of the money so accumulated, there are yet millions of money constantly lying idle in their vaults.

The periodical reports of these institutions show them generally in a most flourishing condition, and their business constantly on the increase. They are all at this time using the greatest exertions to keep up the monthly dividends to their patrons of one per cent. per month. Indeed there seems to be a sort of business rivalry going on between them, and the point to be gained by this rivalry seems to be, in the opinion of their officers, that the institution that succeeds in making the greatest monthly per cent. dividends will be entitled to and will receive the greatest amount of public favor and patronage. All this seems very well. It is claimed that these banks are begetting habits of frugality and economy among the laboring class.—That they are thus utilizing the loose capital of the country and assisting

energy and enterprise to improve our farms and generally to develop and turn to good account the resources of the State. These are undoubtedly good objects, and those in part for which Savings Banks on this coast were originally organized and set in operation. But are not most if not all of these objects being defeated by the manner in which these banks are managed? Will a strife or rivalry between these banks to keep up money to a high rate of interest help energy and enterprise to develop the resources of the State? Will one and a fourth per cent. per month improve our farms, open and work our mines, build and run our factories? Will this high rate of interest heget and sustain energy and enterprise in any permanent and legitimate business? These are the abuses and not the uses of savings banks, and these abuses call for the exercise of the law-making power of the State.

But there are other points of complaints against these banks, which can only be removed by the force of public opinion, and the exercise of good liberal business judgment and discipline by their managers. Some of them refuse to loan money except on city real estate, and would prefer to take as security a non-productive sand bank owned by a speculator merely because the winds have heaped that sand up within the limits of San Francisco—than a good productive and well improved farm in the country, owned and worked by a judicious, energetic farmer, with a well established reputation for honor and integrity.

Again, the officers of these banks by refusing to recognise the intrinsic value of permanent and valuable improvements on land, are discouraging and retarding those improvements when by their position they could and should encourage them. For instance we published in our last week's issue the fact that Mr. Bughey of the Natoma vineyard, in an action against the Natoma Canal Co. for damages in going through his vineyard, showed, by several witnesses, that eighty-five to ninety thousand of his vines produced from 600 to 800 tons of grapes, worth at least \$50 per ton, or more than \$30,000, and that after the commissioner had taken testimony in the case for more than twenty days, and had visited the place, they rendered an award in favor of Bughey and others for nearly \$2,000 per acre for the land and vines thereon used and destroyed by the company. Again it is a notorious fact that the product of good vineyards throughout the State is at least three tens of grapes a year per annum and that they are sold at from \$20 to \$30 a ton for wine purposes. Notwithstanding these facts which all other business men recognise and act upon; we know that some of the Savings Banks refuse to place any additional value on land in consequence of its having on it valuable productive vineyards, and that this unnecessary and illiberal rule is working very disadvantageously to the increase of this crop of valuable and permanent improvements in the State. There is too much idle money and too many idle men among us, and this illiberal course of the Savings Banks is increasing rather than relieving the difficulty.

THE Sacramento Beet Sugar Company has obtained a first-class expert from Germany, Herr Ernst, who prefers the diffusion process to that in use in Alvarado. The company has four hundred acres of beets on the American river bottom not looking very promising yet, on account of north winds. It contemplates getting a seventy-five ton sugarcane in time for the present crop. Two acres of water-melons are put out as an experiment in melon sugar making.—*Alta*.

A COSTLY CARPET.—The Sultan of Turkey has presented the U. S. Government a magnificent carpet manufactured expressly for the East Room of the White House. It is woven in one piece, was made at the Imperial factory, being a year in preparation, weighs 1,500 lbs., and is said to be worth \$9,000 to \$10,000. Red and blue are the prevailing colors.

COAL AT ASPINWALL.—A telegram, dated Aspinwall, April 25th says: A discovery has been made of coal mines and oil wells, thirty miles from Aspinwall. The mines are reported to be inexhaustible, and the coal of a superior quality, equal even to the best imported.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, April 29th: Fine ore still coming out of Monitor No. 3.... Work on the M. & N. W. Mill progresses. More men will be put at work Monday. The amalgamating machinery has been ordered, and the Stetefeldt furnace will be running in July.... Krom's Dry Concentrator will soon be tested in Monitor.

The *Chronicle* of April 29th says that the mining prospects are more flattering than at any former period in the history of the county. Capital is coming in. Some valuable ground is about to be transferred, and some extensive mining operations inaugurated.

AMADOR COUNTY.

BURNED.—*Dispatch*, May 6th: The chlorination works, owned by Breedlove & Tarr, near Sutter Creek, were completely destroyed by fire on Thursday of last week. The loss is estimated at \$6,000.

EIGHTY-FOUR POUNDS.—*Ledger* 6th: We saw at the office of Wells, Fargo & Co., Wednesday, two bars of gold each weighing forty-two pounds.—They were the product of a two weeks' run of one of our quartz mills.

THE AMADOR MINE.—The work of re-timbering the Eureka shaft progresses, and they are now down about eleven hundred feet.

ELDORADO COUNTY.

GEORGETOWN.—Cor. of Placerville *Democrat*, May 6th: The Taylor Co. have the shaft completed, and are pushing the drift towards the ledge at the rate of two feet per day. Mr. Hart has leased his claim for six months to E. W. Blaisdell & J. H. Morgan, of San Jose. They having the privilege of buying at any time during the six months for \$3,500. The St. Lawrence claim have been crushing rock which yielded over \$15 per ton. They are pushing down their shaft and the ledge is improving. The Eureka is running hut as yet has not cleaned up. Everything looks finely. J. H. Adams and others of San Jose, are opening a valuable claim below Garden Valley.

INYO COUNTY.

KEARSARGE.—*Independent*, April 29th: The immense improvements at the mine and mill are about completed, and Supt. Winters will find things in tip-top shape. The tramway will be finished to-day; the turbine wheel is ready for motion. Six Wheeler pans have been added to the mill, and on the 5th of May the works start up for all time. There have been some 40 men employed; this force will now be transferred to the mine.

The Deep Spring mill is now in motion, operating successfully, and getting out good bullion.

BULLION.—During the week ending Saturday the 22d inst., there were shipped from the furnace of Mr. V. Beaudry, at Cerro Gordo, 1,225 bars, weighing 84 pounds each.

NEVADA COUNTY.

NORTH BLOOMFIELD.—Cor. of *Transcript*, May 7th: The Yuba Co.'s shaft, pursuing its downward course, with bright prospects. The French Corral Water Co. commenced sinking a shaft a few days ago on the line of the gravel channel.

GOOD CLEAN UP.—*Grass Valley Union*, May 3d: The Webster mine cleaned up Monday, for one day's run, \$1,200. The gravel has every appearance of being a very large deposit. We tried a pan ourselves, on Monday, and got \$9.

JOHN BRIGHT MINE.—Same of 4th: A company of men are working the mine on shares. The mill has five stamps. A few days ago a run of quartz was cleaned up and the result was \$2,100. This gives the miners at work on shares, \$6 a day to the man.

THE MINING SITUATION.—Condensed from same of 7th: The Eureka made a good month's run. Rock, the richest yet, came out a few days ago.... The Idaho mine is steadily paying.... East Eureka, or Grass Valley Consolidated, is now owned by an English Co., who are putting up crushing, hoisting and pumping machinery.... The Webster breast of gravel is 85 feet long and has been carried along for 20 feet. The bed-rock is rolling, but has a general inclination. During this week, or for six days, 195 ounces in round numbers, of gold have been taken from the drift, and this was worth \$3,510. The drifters have been 20 in number, in two shifts of 10 each.

This will give a labor account of \$360 for the week. Water expenses and the cost of running the machinery amount to comparatively a small sum. We visited the mine yesterday. We could see gold in every car load raised.... In the Altona, the shaft is sunk to bed-rock through rich gravel, and a tunnel is being run from the bottom. In two weeks everything will be ready to take out gravel to good advantage.... Hope Gravel mine last week cleaned up 107 ounces of gold, worth \$1,800, and this week about 100 ounces. The Hope crushes all that comes out. It may be that the bed-rock tunnel now about completed easterly will tap a large body of rich gravel.... In Alta No. 3, the shaft bottomed on bed-rock, higher by fifty feet than was expected, but in every way from the bottom, where drifts have been run the rock pitches. On this bed-rock more or less gold is seen in gravel.... Hope No. 2 are getting machinery into place for the purpose of sinking to bed-rock. The claim is near the east slope of Alta Hill.

PLACER COUNTY.

THE GREENE MINE.—*Herald*, May 6th: Wm. G. Greene got his new 4-stamp mill and one Hepburn pan to work last week and run through 12 tons of ore which yielded some \$14,000 in melted gold—over \$1,100 to the ton. This is the most astounding yield we have ever chronicled, and we doubt if it has ever had its equal from the same amount of gold bearing quartz. Another new pan will arrive this week, and when everything is completed it is expected that 10 or 12 tons of ore per day will be worked. There is now on the dump at the shaft one or two hundred tons of ore, fully half of which is rich. This mine has been extensively prospected by shafts and drifts and all expenses, including the mill, pans, and machinery, have been met by running small portions of the quartz through an arastra occasionally or pounding out gold in a hand mortar.

COLFAX.—Cor. of same: I saw yesterday some excellent prospects from a ledge lately discovered at Secretown by Peter Groves & Co. They are now forty feet deep and the ledge will average two feet in thickness. The gold is generally diffused through the rock. The prospects of the Rising Sun were never better. I would say, judging from the quality of rock on the dump, that they will pound out \$7,000 this month. J. A. Hoagland & Co. will move their machinery from Iowa Hill, in a few days, to Emigrant Gap. This is a new ledge.

GOLD IN BULK.—*Stars and Stripes*, May 4th: Last Sunday a Chinaman sold to Hubbard & Andrews a small slug of solid gold about an inch wide, an inch and a half long, somewhat thicker than a twenty dollar piece, weighing twenty-three dollars, which bore evidence on both ends that it had been chiseled or chopped with a dull instrument from a solid mass. For eighteen months Chinamen have at intervals sold to the same firm blocks of gold, bearing similar marks, weighing 40, 50, 100 and as high as 200 dollars each.

GOLD SHIPMENTS.—Last Monday Hubbard & Andrews shipped to San Francisco thirty thousand dollars' worth of gold. Their Monday shipments have for some time averaged twenty thousand dollars and upwards.

PLUMAS COUNTY.

SLATE CREEK.—*Quincy National*, April 29th: Brewster & Hawthorne have commenced running their pipes and have a very large head of water. This is the first operation of the season commenced in that section, on a large scale.

LA PORTE.—We learn that water is becoming plentiful, and the miners are hard at work. Conly & Cowell have commenced piping, and will as usual, make a very large clean-up. Baker, Eberly & Co., of Secret Diggings, have also commenced running. They have excellent prospects. The Bald Mountain Tunnel Co. is pushing ahead, and it is thought that the tunnel will develop very rich ground. They have let a new contract for running a hundred feet more tunnel, at the rate of \$8 per foot. The Alturas Co. have good prospects, and will commence pushing ahead in a short time.

SIERRA COUNTY.

ITEMS.—*Messenger*, May 6th: P. Grant, owner of the Leonard quartz mine and mill, has gone to work to make the thing pay. He is now crushing rock.... It is estimated that the North American gravel claims at Whiskey Diggings, will take out \$50,000 this season.... The Shamrock gravel claim, on Fir Cap, paid 280 ounces in the last four weeks, working night and day with five picks to a shift.... Bordwell & Cooley started a tunnel in the first ravine east of La Porte, nine years ago, and were laughed at. A few days since rich gravel was struck at the end of a tunnel 1,700 feet

long. The larger portion of this ridge is in Sierra.

ITEMS.—*Democrat*, May 4th: The Keystone mill, 12 stamps, after a run of 30 days, cleaned up over \$22,000.... The contract of 500 feet tunnel on the Bigelow is completed, and they are now cutting across the ledge.

TUOLUMNE COUNTY.

THE HUGHES CLAIM.—*Sonora Democrat*, May 6th: In this claim, near Jeffersonville, Mr. Hughes has just put up an eight stamp mill for the purpose of crushing his gravel tailings, of which he has on hand 6,000 tons. The gravel when first extracted is thrown into a circular iron vessel; it is there exposed to the action of water and a set of large revolving iron teeth by which the hard, grey concrete, is torn to pieces. This operation is carried on in a mill close to the tunnel's mouth. The tailings are carried in sluices to the new mill an eighth of a mile below.

YUBA COUNTY.

SUCKER FLAT.—Cor. of Marysville *Appeal*, May 4th: Hydraulic mining is carried on more extensively here than in any other part of the State. The first claim above Timbuctoo is called the Estner claim, and is owned by the Excelsior Canal Co. Next comes the Babb Co. who are running a bed rock tunnel which they intend to complete in six months, when they expect to strike very rich pay dirt. The Rose's Bar Co. are running two heads of water. They are also running a bed rock tunnel that will tap the lead 80 feet below the present working level. This is no doubt the richest claim between here and Timbuctoo. Immediately adjoining is the Pittsburg Co. which at present have shut down. The Blue Gravel Co. are piping away in the upper strata, and running at the same time their bedrock tunnel. The Union claim, owned by the Nevada Ditch Co. at present is lying idle. The Blue Point Co. are making their way down to the bedrock to obtain a place to work from. It is estimated that the next clean up will reach \$80,000. The company are using five pipes, and have ground enough to last many years. This is one of the richest hydraulic claims on the Pacific Coast. The Smartsville Co. are running two heads of water, and expect to make a big clean-up next week. The Enterprise Co. are running a tunnel, for a sluice way, to the upper portion of their claims, which they will not complete in less than a year.... Timbuctoo is dead, and its buildings deserted.

Nevada.

COPE DISTRICT.

The Elko *Independent* says that the Humboldt lode, Lone Mountain, shows a 4-foot ledge at depth of 30 feet; and that specimens exhibited, are estimated to contain \$200 per ton.

ELY DISTRICT.

OUR MINES.—*Record*, April 30th: All are looking well, and the dumps are kept full as fast as the ore is hauled off. New developments are constantly made as the sinking goes on, and rich ore is taken out.

IMPORTANT SUIT.—The Washington and Creole companies have commenced an action against the Meadow Valley M. Co. for the recovery of the ground known as the "Creole Ledge." The property in controversy also includes a portion of the M. F. ledge. These mines are among the most valuable in the district.

BULLION.—Wells, Fargo & Co., shipped yesterday by the way of Salt Lake, for the Meadow Valley Co., bullion \$12,762.48; for Raymond & Ely Co. \$11,481.50.

Same of May 4th: W. F. & Co. shipped to-day by way of Salt Lake, for the Meadow Valley Co., bullion \$10,801.35; and for B. W. Field, \$6,789.06; total, \$17,590.41.

ITEMS.—The owners of the Alps have refused \$50,000 in gold coin for their mine. The Highland Chief shows every indication of being near the ledge. Thousands of tons of rich rock in our district wait more mills.

EUREKA DISTRICT.

ITEMS.—*Sentinel*, May 6th: Roslin furnace is running on ore from the Elise and Hamburg mines, and producing four tons of bullion per day, of as high grade as ever made in the place.... The miners in the Richmond yesterday brought to the surface a single specimen of ore weighing 1,298 pounds, which assayed \$371 per ton.

TYBO.—Cor. of same: This is 12 miles south from Hot Creek. The Two G is the principal mine. It belongs to Gillette & Gally. A shaft is down 35 feet, and a level in 20 feet. There is 70 tons ore on the dump. Of this same ore, 2,300 pounds smelted at Eureka, gave the mine \$130; and four tons milled at Belmont gave \$100 per ton. A custom mill would do well here.

HUMBOLDT.

ARIZONA CONSOLIDATE MINE.—*Silver State*, May 6th: The force upon this mine has been increased to 65, who bring to the surface daily 40 tons of ore. The whole body of the ledge is taken out and brought to the surface where it is assorted into milling and shipping ore. Should the ledge maintain throughout the claim its size as inferred from the extensive explorations already made, there will be 1,600,000 square feet of ledge surface at an average thickness of two feet, which at \$75 per ton, or \$5 per cubic foot, will make \$16,000,000 in silver.

NORTH STAR.—At 150 feet from the mouth of the tunnel, a fine body of ore has been cut into, which is little inferior to that in the Arizona.

SHEBA MINE.—The concentrating mill is crushing ten tons of \$50 ore per day, which is reduced to one ton of \$500 ore, for shipment. The mill is at work on the large accumulation of low grade ore thrown to one side when the mine was formerly worked. The ledge is exposed 120 feet along its course and shows 2½ to 3 feet in thickness the entire distance.

DE SOTO.—Work is prosecuted with a light force, owing to the fact that it is owned by parties in San Francisco who are a little tender footed in mining operations where an outlay of money is required. All accounts bear testimony that the mine is looking exceedingly well, with large quantities of ore in sight, equal to that now being found in the Sheba.

POTOSI.—Contractors had reached the ledge and found it eighteen inches thick and well charged with splendid ore of this kind for which the Arizona belt is becoming famous.

REESE RIVER.

THE MILL.—*Reveille*, May 4th: The machinery of the Knickerbocker mill has nearly all arrived. The hoiler and engine are on the road, and the whole will be delivered at the site within the week.

BULLION.—The shipment through Wells, Fargo & Co., for April consisted of 100 bars, weighing 8,330 pounds, of the value of \$104,282.56.

BELMONT.—*Ely Record*, April 30th: The El Dorado South, is still worked by Leon & Co. Fine hoisting works have been erected, and a depth of three hundred feet reached. Below the water line the vein is 11 feet wide and the ore averages \$250 per ton. The Transylvania, owned by Canfield, is extensively worked and proves remunerative. Many other mines, that have lain idle for a long time, are being worked. Canfield's mill is kept steadily at work, has a Stetefeldt furnace attached, and gives general satisfaction. Under the present impetus given to mining it is impossible for the mill to crush half of the ore taken out, and large quantities are shipped to Austin. Many who left Belmont a couple of years since, are going back.

WASHOE.

SAVAGE.—*Enterprise*, May 7th: The yield has averaged 110 tons per day, milling \$23 to \$25 per ton. The principal portion is from the eighth and ninth levels.

HALE AND NORCROSS.—The dividend for May has been passed, owing to expenses to be incurred in sinking an incline to open another level, and in re-timbering between 500 and 600 feet of the main shaft.

CHOLLAR-POTOSI.—During the week, this company have extracted 1,690 tons of ore, 1,565 tons of which have been sent to the mills. The average assay of this has been \$55. The bullion shipment for the week was \$84,066.

GOULD AND CURRY.—The re-timbering of the shaft is completed within five feet of the top. The replacing of the bases of the main truck and the connecting foundation timbers adjoining the machinery is carried on with energy. The sinking of the shaft will shortly be commenced.

IMPERIAL-EMPIRE.—They are raising from the 1,300-level on the Holmes ground and are now up fifty feet. No ore is being extracted.

SEGREGATED BELCHER.—There are now extracted 25 tons of ore per day. The Eureka mill is kept constantly running. The bullion shipment for the week amounted to over \$14,000.

OPHR.—The new wheel will be in place and the water pumped out to-morrow or next day.

CONSOLIDATED VIRGINIA.—In pushing forward the north drift from the main west drift hard rock has been encountered. It is now being advanced north-easterly.

YELLOW JACKET.—The average daily yield has been 175 tons averaging \$34 per ton, principally from the 1,000-foot level.

DANEY.—The drift from the bottom of

the main shaft will reach the lead the first of next week.

CROWN POINT.—The Co. are taking out 165 tons per day, which averages \$35 per ton without being assorted.

CALEDONIA.—This company are taking out the usual ore. Last Wednesday they filed their certificate of incorporation. Capital stock, \$2,000,000.

SIERRA NEVADA.—Still shut down by the Kenosha injunction. Ore is being taken out on a contract from the Sacramento and Meredith portion of the mine, and some prospecting is being done on the Sierra Nevada end of the claim.

LADY BRYAN.—The Lady Bryan will start up in two or three days. The pump is working finely. A force of miners is getting out ore, and a large amount is now on the dump.

SURTO TUNNEL.—The Tunnel was in last evening 1,945 feet. The ground works well, and a full force of men is employed. There is no water coming in.

OVERMAN.—This is yielding about as usual. The ore is mostly low grade, assaying \$21. It mills 65 per cent. of the assay.

CHEAP PROPERTY.—The Hope mine, in lower Silver City, with a pony engine, cars, car track, tools, and all the realty connected with the mine, was sold on the 5th by the assignee in bankruptcy, to H. H. Flagg, for \$1,000. This is the cheapest piece of property that we have heard of lately. We understand that the mine will start up again shortly.

BULLION.—The following is the shipment of bullion by Wells, Fargo & Co. from this city for the quarter ending March 31: The shipment for January was \$850,446.53; for February, \$921,267.98, and for March, \$871,836.35, making the total \$2,643,443.86.

WHITE PINE.

REVIEW.—*News*, May 6th:—There have been some 20 mines started work during the week. One more mill (the Stanford), has commenced running. There is no lack of ore, out and ready for sending to mill. Treasure Hill is crowded with huge dump piles. The Tramway, which made an unsuccessful attempt last week to start, has been undergoing a remodeling process, and a large force has been employed. There have been many new discoveries made during the week. Smelting works which, for a long time, have remained idle, are being placed in repair, and many improvements made.

ITEMS.—Work continues in new shaft on Eberhardt ground. The rail track to the tramway, 600 feet, is completed. Original Hidden Treasure never looked better. The new south shaft still going down through ore. About 300 tons on the dumps ready for mill. In Ward Beecher Consolidated, main shaft is down 75 feet, with indications of ledge at hand. South Aurora still sends ore to Stanford mill. Daily yield averages 45 tons. Silver Wave raises 20 tons daily, worked at Swansea mill. High grade ore body in Virginia holds out. Gen. Lee tunnel is in 30 feet; for the last 12 feet through ore. North Iceberg tunnel shows high grade ore for 8 feet on each side. Empire opens up wide, with good ore. Old Combination Co.'s mines looks finely; 200 tons on dumps. Charter Oak is worked under lease. Silver Plate has much ore on dump. Truckee has started up work under the new purchaser. Live Yankee ore assayed \$217; average sample. Pocotillo prospects improve daily. Of the base metal mines, Lucky Boy shaft is down 80 feet. Raises 1½ tons ore daily which assays \$140. Three men are working. Margaret has started work in earnest, after much cleaning up. Caroline shows a silver brick every week. High grade ore in Alhambra holds out, and the vein grows wider. Lower drift in C. T. Fay is in good ore all the way.

OUTSIDE DISTRICTS.—Tem Pinte mill is in constant operation, and another is projected. Troy mill will be finished by the last of June. Piermont mill has ore enough out to last some time. The Mineral Hill property has been sold to an English Co. The mill turned out \$120,000 in bullion last month.

MILLS AND FURNACES.—Stanford mill started up Monday on South Aurora ore. It works 50 tons daily. Big Smoky mill has plenty ore on hand and engaged for the whole season. Oasis is running on Ward Beecher ore. Swansea on Silver Wave. Engine and boiler for the Monte Cristo are on the road. Manhattan will be in trim this week. Metropolitan runs steadily. Big Smoky furnace is ready for work. Repairs in Alsop works nearly completed. It is said that the Rothschild Works will start up this month.

Arizona.

BRADSHAW.—Prescott *Miner*, April 29th: A town site has been surveyed in the midst of a fine growth of pine timber and springs of purest water. Sixty lots are taken and several parties have already built cabins. The site is on Bradshaw mountain, supposed to be 7,500 feet above the sea level. The excitement is on the increase.

ITEMS.—Mr. Pointer, Walker District, had made a run on several tons of ore, which gave \$75 per ton. The rains have raised the mountain streams, and the placer miners are busy. About two sluice-heads of water are running in Lynx Creek, and the boys are getting \$4 to \$15 per day each. From the Hassayampa we hear a similar story. Men are scattered along the creek from Noyes & Curtis' mill, for eight miles down, and all are doing well. The latest sensation in Big Bug is a new lode discovered a mile below the mill, reported to be very rich in gold.

Colorado.

PELICAN.—*Herald*, April 29: This lode, owned by J. McCuniffe, in Griffith district, is yielding very rich ore. Two assays, this week, gave these results: First and second class ore, average ore taken from heap at Palmer & Nichols' mill after being pulverized ready for treatment, 953 ounces of silver per ton, coin value, \$1,239.42. Third class ore, 248 ounces silver, coin value, \$322.50. The pay vein is from 6 to 16 inches in width.

PEWABO.—*Register*, April 26: Harker & Waterman are working the mine, under lease. They took out the water, and have reached a depth of 225 feet in the main shaft, having sunk 85 feet. The first 25 feet contained some pay; from that point down the crevice was wide, and filled with excellent ore. At the bottom the ore is not so good. As a whole the mine promises extremely well.

CARIBOU.—Cor. of same: The main shaft at a depth of 170 feet carries a three foot vein of the well-known "first-class Caribou ore." The east shaft worked by the old Caribou Co., now 90 feet deep, has a very fine vein of ore, 14 inches in width. A portion of the mine appears better than we have before seen it.

ITEMS.—Snow & Co. are working claims No. 3 and 4 on the Kansas lode. The bottom of the shaft, 150 feet from the surface, has a good crevice of ore. The first-class is sold to Prof. Hill, and the mill ore yields from 6 to 8 ounces per cord.

IDAHO DISTRICT.—THE GOLD SHIPMENT.—The total shipment by the three banks at Central City for April is \$92,550, coin value. And the total value for the year, so far, is \$378,250. The first four months of the year are always the poorest. It is pretty clear that our shipments from Gilpin county this year, will fall little short of two millions.

GEORGETOWN.—*Miner*, May 4th: The Marshall Co. are shipping \$6,000 silver bullion this week. Bismarck lode has a pay vein of 14 inches, solid. Stewart Co. have shipped, during the last 6 days, \$6,921 in bullion. Glen Alpine lode has a shaft 37 feet deep, and a drift 24 feet long. Palmer & Nichols' Reduction Works are in full blast. The new amalgamating barrels will soon be in running order. Bullion shipments for the week were \$5,431 ounces, coin value, \$5,809. College Lode, Republican mountain, furnishes ore assaying \$1,320 coin. Work in South American lode has been temporarily suspended on account of water. A drain tunnel has been commenced.

Montana.

BLACKFOOT.—*New North-West*, April 28th:—A company has been running a cut from Ophir into Blackfoot, and cleaned up Saturday \$4 per day to the hand for the week. They expect \$8 this week. Many absentees are returning to their claims for the summer's work. The Warm Spring Bar is attracting attention. There is fully one hundred acres and it prospects well. Geo. Bernard & Co. are bringing in a ditch five miles long from Snow Shoe.

QUARTZ GULCH.—Cor. of same: No. 20, above Upper Discovery, pays as high as eighty dollars to the set of timbers; Discovery is paying wages; and No. 17 below prospects from five cents to \$2.50 the pan, with four feet of gravel. Long Bar is paying well. Col. Miller made \$32.75 last week and wheeled the dirt 5,000 feet and washed it with a rocker. Nuggets weighing respectively \$30 and \$19.26 were lately taken from No. 17.

SILVER BOW.—Cor. of same: "Pioneer Ditch is brim full of water, and the miners are using it. I understand the ditches at Butte are full. Miners generally are looking jubilant, and anticipate a long run of water and a prosperous season."

Mining Stock Market.

(S. P. Stock and Exchange Board.)

SAN FRANCISCO, Thursday Eve., May 11.

The stock market has been much excited during the week. Crown Point has risen higher than ever, reaching \$275 on Monday, or over 100 per cent. higher than ever before. Belcher has also risen far above any previous point, touching \$130 on Monday and Wednesday, and \$136 to-day. Amador has sold at \$350 to \$360, and Eureka at \$85 and \$83.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week:

Dividends.

During the month of April, mining incorporations disbursed dividends as follows: Amador, \$4 per share, \$14,800; Black Diamond Coal, ¼ per ct., \$25,000; Chollar-Potosi, \$10, \$280,000; Eureka (Cal.), \$2, \$40,000; Eureka Cons., 75c, \$37,500; Hale & Norcross, \$5, \$40,000; Natoma Water & M., 1 per ct., \$3,000; North Star (Cal.), \$3, 9,000; Raymond & Ely, \$1, \$30,000; Redington Quicksilver, \$1 per share; Union Pacific Salt, ½ per ct., \$1,500; Yellow Jacket, \$2½, \$60,000.

On the 10th inst., the following dividends were paid: Amador, \$9,250; Chollar-Potosi, \$140,000; North Star, \$12,000; Yellow Jacket, \$60,000.

SERICULTURE.

Feeding the Worms.

In our last article on this subject, we had watched and fed the little worms, from the day we lifted them off the cards of eggs, until they had grown to more than double their size when first hatched. We had noticed their gradual change of color from an almost jet black to a grayish color, especially about the head. We had seen that as they approached the time for the first sleep or molting, they had assumed a yellowish or hilly look, and that many of them had disappeared under the leaves. We had waited from 24 to 48 hours and had seen them re-appear on the surface of the leaves, very much brighter and

ing—from five to six days. The fourth from third to fourth molting—from six to seven days. The fifth from fourth molting to spinning cocoons—from eight to ten days.

In good weather all these changes are passed in this State in about thirty-two days. We have had the Japanese bivoltines make cocoons in twenty-eight days, and we have known the annuals to occupy forty days,—when the weather was unfavorable.

In China, the Chinamen say that the worms frequently make cocoons twenty days old. The nights there are much warmer than here, and the worms eat as rapidly in the night as in the day time, and grow much more rapidly and pass through the moltings more quickly, than here where the nights are cool.

condition for the worms to sleep on, as they will pass through the molting much more successfully on a dry bed than on a cold wet one. When the worms are asleep they must not be fed at all.

At these molting times is the greatest danger of trouble. If the bed of leaves is too thick and damp, the worms are a long time in molting, and they are apt to come up from molting very unevenly as to time and to appear weak and feeble. This latter condition may be known by the great amount of fine web, spun by the worms on the surface of the bed as they wake up and begin to move about. When you see this it is best to remove them from the old bed as soon as possible, even though you leave some still asleep to be thrown away. If, however, the bed is in good order and dry, the worms will wake up evenly, appear

grow larger, these strips may be cut wider, and when the worms are still large, whole leaves may be used for this purpose. The worms will leave the bed of fine leaves and climb upon these strips. Now watch them and when they are generally on the strips and before they have eaten them so much that they will not hang together, lift these strips up carefully one by one and lay them carefully down, on a clean paper. If the worms are too crowded on the old bed, and they generally will be so about every other day, put those from one paper on two or more papers. It is very important that this matter of changing and dividing be properly and most rigidly attended to.

It may be of some assistance in aiding the judgment of new beginners to observe the following directions as to space that a certain number of worms should be made to occupy during the different ages.

For convenient reference on this subject and to assist in determining what number of eggs should be hatched or worms fed on

ILLUSTRATED TABLE—SHOWING THE SILKWORM FROM THE EGG TO THE MOTH—LIFE SIZE.

lighter colored, and anxiously moving about over and under each other, and at the slightest movement near them, sticking up their heads and swinging back and forth as if trying to reach something. And when we noticed them more closely, we observed that all the little fine black hairs that covered their tiny bodies before they went to sleep, had disappeared. These several changes are indications that the first age of the worm had passed—that they had shed their skins for the first time; or in other words that they had passed the first molting and had entered upon the

Second Age.

That we may be more certainly understood by new beginners, for it is for their instruction that we write, we will state here that the silkworm passes through five stages or ages from the time of hatching to the time of making its cocoon. The first age is from hatching to the first molting, and, under favorable circumstances—that is, in uniform warm weather and good feeding and care—the time of this age is from five to six days. The second age is from the first to second molting—a period of from four to six days. The third age is from the second to third molt-

Male Moth.

Female Moth.

We will give here a description of the appearances and changes of the worm as it approaches all the moltings except the first, which we described previously, so that even the new beginners can not fail to perceive when these changes are approaching. The first indication is that the appetite begins gradually to fail; and the worms seem inclined to rest or lay quiet. When fed they will stir up and crawl on the fresh leaves and eat a little, but soon leave off eating and crawls over the food, not in search of something to eat but for a spot for rest, and some leaf or stem to which to attach itself for a long quiet sleep. When these signs are noticed, feed very lightly and with very finely cut leaves, so as to let the bed of leaves become dry and in good

strong and vigorous and hungry, all other things being well. If the bed of leaves turn black under the surface at any time it is an indication that they are heating or fermenting and the worms should be got off of that bed as soon as possible.

Changing and Dividing.

We have as yet said nothing about changing the worms from one bed to another, so as to keep them clean, and dividing them up and spreading them out as they become too crowded by their growth. As a general rule the worms should be changed from the old bed about every other day. The best way to do this is, at the regular time of feeding, instead of giving them their food in its usual condition, cut fine, to select some very tender soft leaves and cut them up into strips, say half an inch wide, and lay them all over each bed of worms to be changed. As the worms

any given number of trees, we will state here the amount of space, say one hundred thousand worms or those hatching from about three ounces of eggs should occupy at the close of each age, and the number of pounds of food they will consume during each age.

One hundred thousand worms should be made to occupy, at the close of the first age, about twenty square feet of surface, and they will consume during that age about twenty-five pounds of leaves. During the second age they should occupy about forty feet of surface, and will consume about 75 pounds of leaves. During the third age they should occupy about 90 feet of surface, and will consume 230 pounds of leaves. During the fourth age they should occupy about 225 feet of surface and will consume 695 pounds of leaves. During the fifth and last age they should occupy about 500 square feet of surface, and will consume about 5,975 pounds of leaves, or 6,995 pounds in all.

It will be seen by the above that while the worms occupy but little space, and eat but little during the first half of their existence, during the last half they spread out very rapidly and eat very voraciously. So that while there is but little work to attend and feed them during the forepart of their lives, the work increases very rapidly during the latter. After each molting the worms may be feed once or twice before they are removed from the bed where they have deposited skins, but not more than that. The first feeding after molting

should be light and of tender food, as the worms are then weak and very hungry, and if fed too much then they are apt to hurt their appetites for food when they become stronger and should have good appetites.

Our Illustration.

In our issues of April 29th and of to-day we have given such information in regard to silkworms and their management, as should enable amateurs readily to experiment in this pleasant culture, and thus aid to develop an industry which promises to become one of vast importance to California.

To-day we supplement that information with the accompanying accurate and life-size representations of the silkworm, from the laying of the egg until it emerges from the caterpillar life, through the chrysalis to the moth that lays the egg—omitting only the 2d and 3d, and the 5th and 6th days of the 5th or last age—the regular growth during this stage being made sufficiently clear by the appearance of the worm during the 1st, 4th, 7th and 8th days of that age, which are given.

The illustration is so arranged, with marginal references, as to indicate the successive periods through which it passes, and at the termination of each of which it changes its skin, up to the close of the final age, when it begins to look about for some twig or other material to which it may affix its cocoon.

The progressive daily development of the egg is also shown from the time it is first brought into a warm atmosphere for hatching, until the worm makes its appearance. The time thus occupied is about six days, more or less accelerated or retarded, according to the temperature employed. It will be found interesting, and important also, to watch with a small magnifying glass, the gradual change in the color and general appearance due to the development of the tiny worm within the semi-transparent shell or skin of the egg.

The illustration which we herewith present, has been copied from *Appleton's Journal* for November, 1870, which is arranged for a medium period of 29 days. The instruction given in previous issues is ample, even for a person who has never witnessed the process, especially when studied in connection with the illustration here added. It would be well if every family, into which the Press finds its way, would procure a few eggs, and follow out, practically, the instructions we have given. It would afford a pleasant and instructive pastime, and could not fail to aid in increasing the general interest already being felt in every part of the country in the establishment of this important business on the Pacific coast.

POPULAR LECTURES.

The Greek We Speak.

[Prof. Martin Kellogg before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Fourth Series. Reported expressly for the Press.]

LECT. III. May 6.—Having spoken in the preceding lecture of the Latin element in the English language, Professor Kellogg was led naturally to consider next the Greek element. That the latter is not so important as the former in colloquial English, is not to be wondered at. Not, however, because the Greek language was so much older than the Latin and had already lost a part of its vitality before the formation of the English language began. It would be nearer the truth to say that Latin and Greek were contemporaneous,—that they sustained the relative of sisters rather than that of mother and daughter. But in Western Europe—the home of nearly all the original occupants or conquerors of the British isles—Greek was never so potent as Latin. Athens founded no world-empire. Greek was not carried across the Alps by the sword. It did not force its way into every household. But the great strength and wealth of the Greek language and literature were universally recognized by the better educated classes, even in the palmiest days of Rome. Virgil was the diligent student of Homer, and Cicero was not ashamed to learn of Demosthenes. The Greek language is the most wonderful creation in the world's linguistic history. It is a mine of unrivalled wealth, which none but fools would reject.

Earlier in the course, attention had been called to the importance of a knowledge

of Greek to the man of science, but in this lecture the chief aim was to show how much even the ordinary, everyday discourse of an English-speaking people is indebted to the language of the ancient Greeks. A few illustrations from the many given by the lecturer will be all that we have room for.

The Church.—The word church itself is of Greek origin, though not so obviously as many others. The Greek word which corresponds most nearly to our idea of church is *ekklesia*, which appears in ecclesiastical and its derivatives. An apostle (*apostolos*) is one sent; an epistle (*epistole*) is a message sent—a letter to the church. The words seat and denomination are of Latin origin; but the names of the different sects are drawn largely from the Greek. As, for example, Catholic (meaning universal); Episcopal, from *episcopos*, *epi* and *skopeo*, an overseer, the church whose head is a bishop or overseer. The Presbyterians are governed by the elders (*presbyteroi*). Even the word Bible is nothing but the Greek *biblos*, book, anglicized. Genesis (from *genao*) means creation; and Exodus (from *exodos*) the going out. Orthodoxy is from *orthos*, straight (or right) and *doxa*, opinion; heterodoxy from *heteros*, other than straight or right. "Orthodoxy is my doxy; heterodoxy is your doxy."

The School.—School is derived from *scholē*, leisure. The school then is a place where one has leisure to study. The alphabet is properly the A B of the Greeks (*alpha* and *beta*). Grammatical terms are largely of Greek origin, such as Orthography, Orthoepy, Etymology, Syntax (from *sun* and *taxis*—a putting together, hence that branch of grammar which treats of the construction of sentences), the comma, the colon, the period. Geography means a description of the earth (from *ge* and *graphēin*); hence the error of speaking of the "Geography of the Heavens."

Poetry and Music.—The word *poet* is entirely Greek, and means literally the maker, a significant illustration of the character of the ancient Grecian mind. Ode, Harmony, Melody, Rhythm, are all found in the Greek.

Politics.—From *polis*, city, comes a large class of words referring to cities and the management of affairs in cities. Annapolis is equivalent to Anna's city. Chrysopolis is a properly formed word, meaning Golden City; but Copperopolis is a barbarism in word-forming, an English and a Greek word being combined together into one.

Many of the illustrations given were accompanied with humorous allusions which will aid much in fixing them upon the mind of the Professor's auditors. In closing, Prof. Kellogg endeavored to impress upon his hearers the fact that these relations between English, Latin and Greek are not merely playthings to be handled by the lovers of the curious, but that the study of the so-called "dead languages," which are in reality still living in almost every sentence we utter, has a decidedly practical side for every one who uses English.

This lecture finishes Prof. Kellogg's series. The next will be by Prof. Pioda on the Utility of the Modern Languages.

The Activity of Vesuvius

Dr. Colton writes to the Boston *Transcript*, from Naples, under date of March 8th:

Last evening, as we came home from the opera, we saw the grandest spectacle yet presented by Vesuvius. A vast flame, or what appeared such, was issuing from the new crater, and the lava in two streams was pouring down the sides of the cone. Both these streams, I should judge, were five hundred feet wide. Looking across the bay in one direction we saw in the rippling water the red light reflected from Vesuvius, and in another the white light of the moon. The effect was strikingly beautiful. The lava as iron heated to a white heat, and the clouds of smoke and surrounding air were tinged with the red reflection.

Two ladies at our hotel visited Vesuvius to-day, and could only get as far as the Hermitage. They said a stream of lava was flowing directly toward them, and the constant thundering from the old crater was fearful. A stone over two feet in diameter was thrown out and landed near where their horses were hitched. They could see large stones constantly being thrown up. As I look at the crater this evening, I can occasionally see what appears to be red stars flying into the air. These must be immensely large, as we are twenty miles distant. Great anxiety is felt at the Hermitage for their safety, as the lava has commenced flowing down on this side of the mountain.

GOOD HEALTH.

Fat vs. Lean People.

Leanness, at least in the earlier ages, has been considered a reproach, rather than a merit, either in an individual or a nation. Pharaoh's lean kine were never held up as models to the graziers of any age or any country. Brutus was not so very much in the wrong when he entertained doubts about "that Cassius" with his lean and hungry look. The point of one of the bitterest of the many epigrams shot at Voltaire is blunted and rendered harmless by translation into a language where "death and sin" do not rhyme to "thiu." We cannot fancy a fat Macbeth, a corpulent traitor in Venice preserved, or an obese Iago are impossibilities. Assuredly, Falstaff was not scrupulously honest or honorable; but what was he, after all, but a merry rogue? Plumpness and beauty have been regarded as inseparable Siamese twins, from the illustrious regent whose ideal of female loveliness was summoned up in "fat, fair and forty," to the Egyptians who fattened their dames systematically by making them sit in a bath of chicken broth; the etiquette being that the lady under treatment is to eat, while sitting in the broth bath, one whole chicken of the number of those of which the bath was made, and that she is to repeat both bath and dose for many days. A doubt, one should think, must have sometimes arisen, whether the beauty thus in training would fatten or choke first.

As to the question of who would be most likely to sink or swim, on getting into hot water or falling upon troublesome times, the lean person would have no chance against the fat one. Byron certainly, fretted over his increasing bulk; and the same gracious prince who admired rotundity in his favorites, had such a horror of the consciousness of his own corpulence, that "Who's your fat friend?" was the most severe aside-speech that poor, discarded Brummel could make in revenge for being out by his former patron.

A book has been written by a Dr. Dancel, of Paris, in which to be or not to be fat is treated as the grand question of human life. The epitome of welfare is leanness; while the origin of evil, nay, evil itself, is fat.

It appears, that it is only a vulgar error to believe that an increase of what is called good pligh is any symptom of improving health. As an over-sanguine temperament is dangerous; as daily accidents occur from the undue predominance of the nervous system, so does the extraordinary development of the fat cause first inconvenience, then infirmities, and finally constitute a malady hitherto considered incurable, and known as obesity. To men, it is true, personal grace is not indispensable to happiness; but with women the case is different. Dr. Dancel reminds them that when once they have lost their personal attractions, intellectual treasures serve merely to render them just supportable in society.

Fat has ruined the prospects of many a man, as of many a woman, by rendering it impossible to continue a profession which affords them an honorable livelihood. Persons who live by mental labor find their faculties clouded by the increase of the corporeal substance; and literary men—but there is no need to consider that eventually, because it is too outrageous a supposition that a man who earns his bread by his pen should ever have the time to grow rotund and ponderous. With publisher the case is different; often the publishers sucks the marrow, while the author is left the bones for his pains. At one epoch, the Romans, not caring to give room to useless individuals, banished those of their fellow citizens who were guilty of the crime of corpulence.

But all this is mere nothing. Such misfortunes are only slight and few. Thus, *embonpoint* is a common cause of sterility, both in man and beast. A fat queen may cause an ancient dynasty to become extinct, for want of an heir to the throne. The very peasants sell off their fat hens, as unproductive of eggs. Even over-luxuriant plants produce no flowers, or barren ones. Excess of fat causes the human epidermis to crack, mottling the skin with white speckles and streaks; it induces hernias of various distressing forms; it is the parent of ulcerated legs; it gives rise to headaches, giddiness and dimness of sight. In short, among the infinity of causes which originate disease, a bloated habit of body takes conspicuous rank, although modern medical works bestow but little notice on this morbid disposition.

Dyspepsia.

Dr. A. O'Leary lectured recently at Cooper Institute, N. Y., on "Dyspepsia." "Indications of the disturbances of the stomach, are," he said, "caused by the fermentation of food. No one should eat cabbage boiled with meat, or onions with the stalks, as they create biliousness. Cabbage is one of the best articles of food when properly cooked. It should be boiled in pure water. As a cure for dyspepsia a teaspoonful of carbonate of soda, which neutralizes the acid in the stomach is recommended. The causes of dyspepsia are the use of butter, grease, gravy, and eating hastily. Dyspepsia does not come from largo eating. Those afflicted with it should take a short sleep after dinner. The liver has much to do with dyspepsia. Whenever the white of the eye shows a yellow tinge, it proceeds from the liver; tenderness in the pit of the stomach is an indication of a diseased liver. A slight pain under the right ribs and back to the shoulder blade, also proceeds from the liver. Those that are prone to this disease should not sleep too much, or enjoy too much heat—too much heat tends to enlarge the liver. Fruit and vegetable diet is the best that can be adopted, but persons of a weak constitution should add to it meat once a day, but not oftener, with bread, properly made. Persons affected with dyspepsia should not use calomel. Turkish baths are recommended, as they relieve the liver."

What Goes into Your Stomach.

"I have often wondered what the stomach must say to itself while an ordinary meal is coming down. This stomach knows perfectly well what it needs. It asks at breakfast a moderate piece of steak, a slice or two of good bread, and a baked potato. Now, just stand by and see what goes down. First, a great mass of greasy buckwheat cakes, now a swash of scalding hot coffee, again buckwheats, more coffee, sausage, hot biscuit saturated with melted butter, huckwheats, coffee sausage, hot biscuit, and so on and so on for half an hour. And here we have an enormous mass of hot, greasy, doughy, indigestible stuff swimming in hot coffee. The stomach asks at dinner roast beef or mutton, with bread, potatoes and other vegetables. Now, what is the conglomeration that comes rushing down that red canal. Turtle soup, fish, beef, duck, plum pudding, pie, nuts, raisins, coffee, and several condiments; with this hotch-potch, ice water, ice cream, and wine. For supper the stomach asks for nothing, and gets hot biscuit, butter, cake, preserves and strong tea."—D. Lewis.

To REMOVE CORNS.—First, remove the pressure or friction of the shoe which occasioned the corn. Second, keep it moist long enough, and it will drop out of itself or can be easily picked out with the finger-nail; and if it ever comes again, repeat the process. Lockjaw has frequently followed cutting hard corns; at other times convulsions and death. This risk ought never to be run as long as a hit of cotton saturated with water, or sweet oil, or, better still, glycerine, which is the essential element of sweet oil, is a safe, certain, and efficient cure for hard corns, if kept constantly applied for a day or two, and no shoe is worn.—Dr. Hall.

WATER DRINKING.—A certain amount of water is necessary to carry on the functions of the animal economy. During the season of active perspiration, the quantity is considerable. When shall this water be taken into the system? It may be introduced during the day, when thirst requires; but it is a capital practice to introduce a quantity on first rising in the morning, and on going to bed at night. Thousands of dyspeptics have derived signal relief by drinking one, two or three tumblers of water on rising in the morning, and on going to bed at night. I have sometimes thought, on hearing the testimony of these dyspeptics in regard to the influence of cold water thus taken into the stomach, that, perhaps, of all baths, this is the best.—Dio Lewis.

SLEEP will do much to cure irritability of temper, peevishness, uneasiness. It will cure insanity. It will build up and make strong a weary body. It will do much to cure dyspepsia, particularly that variety known as nervous dyspepsia. It will relieve languor and prostration felt by consumptives. It will cure hypochondria. It will cure the headache. It will cure neuralgia. It will cure a broken spirit. It will cure sorrow.

The Bailey Roasting Furnace.

We illustrate to-day a roasting furnace which comes originally from Nevada. The inventor is the agent of the Big Smoky mill, at White Pine, and is known to many of our readers as the inventor of the Bailey revolving cylinder furnace now in use at the mill named. A series of experiments with a small furnace of the kind here illustrated was so successful, that he has had a larger one erected in this city for work on a larger scale.

Fig. 2 shows a longitudinal section of the furnace, and Fig. 1 a cross section (on a larger scale) through one of the fire-places. The letters in both figures refer to the same parts.

A pipe of cast iron, *A*, conveys the pulp from the battery to a fan, *B*, which, by its revolution, sucks the pulp in through *A*, and forces it through the pipe, *C*. This fan is placed at the side of a fire-place, *I*, as shown in the cut, from which it draws in the heat and flame, and thus exposes the ore to an intense roasting influence in its passage through *C*. The arrows denote the direction of the current of pulp, etc.

FIG. 1—CROSS SECTION.

To aid the action and secure a more perfect roasting, the pipe, *C*, is curved at the top and leads to another and larger fan, *D*, similarly placed with regard to a second fire-place, *I*. Thence the pulp is forced under like influences through the larger pipe, *E*, up and over into a sheet-iron chamber, *F*, of the form indicated, which may be placed over amalgamating pans, *G*, if desired, and where the roasted ore is caught and retained until needed for further treatment. In order to catch and save the fine dust, chlorides, etc., a third pipe leads from *F* into a water tank, *H*, as shown.

In the furnace erected in this city, the fan, *B*, is 20 inches, the pipe, *C*, 5 inches, the fan, *D*, 30 inches, and the pipe, *E*, 7 inches in diameter. The dimensions, we are given to understand, may be modified to some extent, and it may be found desirable to add another fire-place for certain varieties of ore. Mr. Bailey has also tried letting a small stream of steam into the pipes with, he thinks, good results in desulphurizing. Where the ore is to be treated to a chloridizing roasting, the salt is added in the battery.

The furnace acts somewhat after the principle of the blowpipe, and regulating the speed of the fans, the openings into the fire-places, etc., the process can be modified as desired. In the original experimental furnace at the Big Smoky mill, where rude 4 and 12-inch fans and 2-inch gas pipe were used, Mr. Bailey informs us he chloridized up to 96 per cent.

The claims made for this furnace are principally, and briefly, as follows: that it utilizes all the products of combustion,

saves all the dust and condensable matter volatilized in roasting, saves all manual handling of the ore after it has been fed into the battery, is adjustable to suit all kinds of ores, is cheap, efficient and easily transported from place to place, and can be used with advantage for conveying ore, not required for roasting, in place of other apparatus.

The furnace built at the machine shops of Garcia & Periam, in this city, contains less than 1,000 lbs. of iron, and 600 brick. The pipe is made in sections, so as to be conveniently handled. The estimated capacity is equal to that of a 10-stamp mill; the estimated cost is \$1,500 to \$2,000. It is especially recommended where Küstel's lixiviating process is used.

Mr. J. W. Bailey, the inventor, has had long experience in milling, and his furnace is the result of years of practice in

borax, melting with oxide of copper, or the addition of corrosive sublimate (bichloride of mercury) to the melted gold. The two former of these plans are troublesome, from the corrosive action they exert on the crucibles; and the last (namely, the employment of corrosive sublimate, which is that usually adopted) is most objectionable, from the dense and highly injurious fumes evolved.

In Victoria, this is regarded as so serious a matter, in a public and sanitary point of view, as to have induced the Municipal Council of Melbourne to institute an action at law against the Union Bank, to compel them to abate the nuisance thus created by their gold-melting establishment. The passage of chlorine gas through the melted gold is found to effect the complete toughening of the metal by the elimination, as volatile chlorides, of the materials which render it brittle, while the evolution of the deleterious mercurial fumes is avoided.

In the metallurgic treatment of the

FIG. 2—LONGITUDINAL SECTION—BAILEY FURNACE.

treating rebellious ores. He will soon invite parties interested in such matters to witness his process. Letters to him should be addressed care of McDonald & Whitney, San Francisco.

Refining Gold by Chlorine Gas.

(Continued from page 278.)

The Manager of the Bank of New South Wales has kindly allowed me the use of 500 ounces of Queensland gold to illustrate this paper. This quantity was divided into two nearly equal parts: one portion, weighing 248 ounces, was left in its original unrefined condition, as seen in ingot on the table; the other portion, weighing 252 ounces was refined in the manner described above, and the resulting bar of fine gold, assaying 995, is placed by the ingot for comparison, and the silver extracted, weighing 38.8 ounces and assaying 991.1, lies beside it.

Besides the separation and recovery of the silver as above described, another useful end is gained by this process.

A very large proportion of the gold of Australia (more especially that obtained by amalgamation from our quartz-veins) is more or less brittle—an effect generally due to the presence of small quantities of lead or antimony, rendering the bullion quite unfit for coinage or manufacture until it has undergone some process to render it tough.

The methods usually employed for this purpose are either fusion with nitre and

precious metals, some loss is always sustained; but that incurred in the process here described is not found to be excessive.

The average loss of gold in operating hitherto has been found to amount to 19 parts in every 100,000 of alloy treated, which is considerably less than would be met with in toughening an equal amount of gold with corrosive sublimate in the ordinary manner.

The loss of silver has amounted to 240 parts in every 100,000 of alloy operated on (containing, originally, say 10 per cent. of silver). There is no doubt that a considerable portion of both these losses would be recovered on further treating the pots and ashes remaining after the operation; and it is found that, as manipulatory skill is acquired, the proportional loss of silver appears to be decreasing. In refining, on the large scale, gold containing 10 per cent. of silver, the cost of the operation in Sydney, including labor and the above loss of premises and superintendence, is about five farthings per ounce, but varying with the quality of silver present in the alloy operated on.

In England, where hydrochloric acid is a waste product of alkali-works, and all apparatus is cheaper, the cost of refining by this method would be proportionally less. The fineness of the gold produced by this process varies from 991 to 997 in 1,000 parts, the average, as found on a refining of many thousand ounces, being

993.5, or 23 carats, 3½ grains. The remaining 6½ thousandths are silver; and this compares favorably with any of the previously known practical processes, none of which leave less silver than this in the resulting fine gold.

If the refined gold be subjected to a refining by chlorine, the amount of silver left in it can be reduced to 0.2 per cent., just as in the refining by the ordinary sulphuric acid process the same result can be obtained by subjecting the refined gold to a further refining with bisulphate of potash. For practical working, however, this would probably never be attempted.

The silver resulting from this method of refining is tough, but its quality varies somewhat according to the gold originally operated on; if the alloy treated contains much copper, the greater part of this remains with the resulting silver, but the other metals are nearly all eliminated.

The fineness of the silver hitherto obtained has varied from 918.2 to 992.0 in 1,000 parts, the average being 965.6. Analysis of the silver resulting from the refining of gold known originally to have contained among the base metals in the alloy, copper, lead, antimony, arsenic, and iron, gave the following results:

Silver.....	972.3
Copper.....	25.0
Gold.....	2.7
Zinc and iron.....	traces
	1,000.0

A very extended series of experiments have been made at the Sydney Branch of the Royal Mint to test the value of this process; and the result has been (as mentioned by the Hon. the Colonial Treasurer, in his speech on the Budget, October 14th, 1869), that "active steps are now being taken to bring the system into operation" in that establishment.

TAP FOR SMELTING FURNACES.—The Eureka (Nevada) *Sentinel* has seen a new "Sub-Surface Inverted Siphon Tap," at the furnaces of the Eureka Consolidated. A tube is run at an angle through the lower portion of the furnace wall so as to reach nearly to the bottom of the molten metal. As the metal rises in the furnace, it rises also in the tube, and overflows into a proper kettle at the discharge end of the pipe. The result of this method of tapping is said to be, by actual tests, that the furnace runs better, the lead comes out purer, the formation of "sows" is prevented, and the work of the smelters is lightened. The description does not fully show the applicability of the name. The inventors are Messrs. Keyes and Arents, superintendent and metallurgist of the works.

A NEW STEAM ENGINE GOVERNOR of great simplicity, and one which is claimed to be more durable and effective than the ordinary steam governors, can be seen at the Engine and Governor Works of Caldwell & Co., No. 113 Beale street, this city. This governor has two hinged arms extending upward from the sleeve which controls the steam valve, one upon each side of the spindle. Each of these arms carries at its upper end an ordinary governor ball. A flat steel spring, which is supported at its middle upon the top of the spindle, curves downward at each side, and has its opposite ends hinged to the upper surface of the balls. By the employment of the curved steel spring, it is claimed that the governor is rendered more sensitive and the supply of steam uniformly regulated, while its great durability renders it much superior to the usual spiral spring of the Pickering governor.

STEAM WAGON FOR CARIBOO.—On the 21st ult., the first road steamer left Yale for Cariboo with a load of 10 tons, amid great rejoicing. Finding that it could easily draw a much larger load, the steamer returned for additional wagons, and was to start again the next day.

TAMMANY DAY FESTIVAL of the Improved Order of Red Men was to be celebrated on Friday of this week (the day we go to press), at New Saucelito. We return thanks for our invitation, and doubt not that the celebration will have passed off very pleasantly by the time our readers have received our paper.

DOMESTIC ECONOMY.

Hints for Housekeepers.

One of the highest and most important duties of the housekeeper is to preserve the health of her household, and to do this she must carefully study the methods by which food can be made palatable, without being too rich for the stomach. In the first place avoid frying; broil your steaks and chops invariably. Cook vegetables so that they will retain their natural flavor; do not drown them in melted butter, which is one of the most indigestible and unhealthy ingredients. If one portion of a dish of vegetables be hoiled in pure water and the other in water to which a little salt has been added, the latter will be found better flavored and more tender; if potatoes, they will be mealy. Onions are especially improved by being cooked in salt water. Their rankness of odor and flavor being mitigated or modified by this process. Green peas and shelled beans should be hoiled in soft water. Hard water may be made soft by the addition of soda. If potatoes boil too rapidly they are apt to fall to pieces, which spoils the appearance of them on the table. Many sorts of potatoes are liable to this defect, even when all the care possible has been taken. When this occurs remove the pot from the fire about ten minutes before they are done, and let them stay on the stove until cooked. In this way the most untractable potatoes may be rendered slightly and boiled without breaking. Avoid the common error of using so many eggs as to make pastry, pudding, etc., tough instead of light. When you see six, eight or ten eggs put down in a receipt for an ordinary sized pudding or cake (unless it is a rich plum cake or pudding), make up your mind the receipt is a bad one, and should not be followed.

How to UTILIZE STALE BREAD.—Soak the bread in cold water. When soft, pour the water off; then to each quart of bread add a pint of flour. Stir into a batter and bake like huckwheat cakes.

GOOD HAMS.—After hams have been smoked take them down and rub the flesh part with molasses, then immediately apply ground and powdered pepper, by sprinkling on as much as will stick to the molasses when they must be hung up again to dry. Hams treated in this manner will keep perfectly sweet for two or three years. This must be done before the fly deposits its eggs, for after this is done nothing will stop their ravages. Try this plan if you want good sweet hams.

To Prepare Lambskins for Ladies' Overcoats.

A correspondent of the New York Tribune gives the following process for preparing lambskins for clothing material:—"Make a strong suds with hot water; let it get cold and wash the skins, squeezing them carefully to get out all the dirt from the wool; wash the soap out with clean, cold water, and cover them with water for twelve hours; hang them over a pole to drain; when partially dry, stretch them carefully on a board, and when a little damp, sprinkle on them an ounce each of pulverized saltpetre and alum; lay the flesh sides together, and hang in the shade for two or three days, turning them over every day to bring the under skin uppermost, till they are perfectly dry; then scrape the flesh side till all scraps of flesh are removed; rub with pumice or rotten stone and with the hands; then lay the cloak pattern down on the flesh side of the skin, trace it round with a pencil, and cut it out with a sharp knife; overcast the edges together on the wrong side, and line with quilted silk. No collar, fur, or trimmings, is worn with an astrachan or lambskin cloak."

Cotswold, Leicester and other long-wool pelts, prepared in this way, and lined and trimmed with some bright material, will be found comfortable, and quite useful in almost every household.

GIRLS AND BUTTER.—Mrs. D. B. Long lately read an essay before the Kansas farmers' club on the making of Butter, in which she "hit the nail on the head" by saying—"Girls must educate themselves for these duties if they expect to make successful housekeepers and always have a good article of butter on their tables, as everybody, ought to have. It is always relished better by the guests if they understand that the hostess manufactures it herself."

Beans without Pork.

The usual way people cook beans is to parboil them; put them in a kettle or pan, and set them in the oven with a chunk of fat pork in them. The grease bakes out into the beans, making a most unwholesome and indigestible mess, destroying all the good flavor of the beans. Now, a method for cooking them recommended by a correspondent of the *Rural New Yorker* is as follows: Parboil as usual, putting in salt to suit the taste. Then put them in a pan and set in the oven to bake, putting in a piece of good, sweet butter. Bake until tender and nicely browned over on top. Beans are very nutritious; and cooked in this way are palatable, digestible, and can be eaten by any one.

Beans with Pork.

If you insist on having pork with your beans, the best way to cook them is as follows:—Pick over a quart of beans, put them to soak over night. Put them to boil next morning, throwing off the water just before boiling point. Cover with cold water again, put in a square pound of nice, sweet, salt pork, and let them both boil together till the beans are tender. When the beans are done, the water should have all become absorbed; they are then put in one pan to brown, and the pork in another, scoring the latter first, through the skin. Before serving, set the pork in the center of the beans. Serve with pickles and horse-radish.

Utilizing Sorghum Seed.

A correspondent of the *Rural World* has been utilizing the seed of the sorghum, the method of which he describes as follows:—We raised, as usual, a small patch of sorghum the past year (a yellow seeded variety); it made a very fine quality of syrup, and the seed has proved, when ground and bolted, to make a good article of flour for pancakes. We were led to the experiment by a neighbor who sent us a few quarts of the flour. When properly raised and baked they are equal to huckwheat, and I think more easily digested. The flavor cannot well be improved; the cakes do not have the tough, feathery consistence of buckwheat cakes, and I cannot see why it (the flour from sorghum seed) should not become a common article of food. We had thrown it to the hogs heretofore, as soon as the seed was separated from the cane at the mill; this is but one of our heedless wastes of the hountiful productions of a kind Providence. How much better to carefully save the seed at the proper time and have it ground, when it will make an excellent slop for the cows or hogs; or cooked, will be fine for hogs or hens. I have no doubt but in the single State of Missouri there has been enough of this seed wasted in a single year, which, if saved and properly used, would have been many thousands of dollars to the producers.

MESSENGERS. EDITORS:—The entrails in dressing sheep for mutton may cause the rank flavor, by tardy removal at the hutcherie, as you quote from the *Agriculturist*. But the most successful mutton renders of Philadelphia say:—"Be careful, in skinning, not to permit the woolly side of the hide to have contact with the carcass, and the meat will never be rank."

Our correspondent makes an important suggestion, omitted by the writer in the *Agriculturist*. The fleece of the sheep contains about half its weight of a semi-viscid, oily substance, known as "yolk," to which is due the peculiarly unpleasant odor of sheep and unwashed wool. The slightest contact of the wool with the flesh, in the process of skinning, must leave upon it a small portion of this oil, the odor of which will be rapidly diffused over and through the flesh.

HOSPITALITY.—To press people to eat more than they wish is vulgar hospitality. Excess of ceremony shows want of good breeding. That civility is best which excludes all superfluous ceremony.

When invited to partake of another's hospitality, and the invitation is accepted, be punctual in meeting the engagement. If unforeseen circumstances prevent the engagement being kept, immediately notify the person by sending an explanatory note.

There is no social duty which the Supreme Lawgiver more strenuously urges than hospitality and kindness to strangers. The perfection of hospitality entertainment is to offer the best to visitors; show a polite regard to their wishes; give precedence in all matters of comfort and convenience."

Domestic Receipts.

MOTHS IN CARPETS may be conquered in this way: Take a coarse crash towel, and wring it out in clean water, and spread it smoothly on the carpet, then iron it dry, repeating the operation on all suspected places, and those least used. Then, by placing a few crumbs of sulphur under the edges of the carpet, the result is accomplished.

MOSQUITOES.—A camphor bag hung in an open case will prove an effectual barrier to their entrance. Camphorated spirits applied as perfume to the face and hands will prove an effectual preventive; but, when bitten, aromatic vinegar is the best antidote.

COFFEE CAKE.—Five cups of flour, one cup of made coffee, one cup sugar, half cup molasses, one cup of butter, one teaspoonful soda, two teaspoonfuls of cinnamon, one of cloves, raisins or currants.

Approved Cosmetics.

Glycerine Balsam.

This is designed to whiten and soften the skin, remove roughness, chaps, chilblains, and irritations from common causes.

Take white wax (pure).....1 ounce.
Spermaceti.....2 ounces.
Oil of Almonds.....3 "

Melt together by a moderate heat in a glazed earthenware vessel, and add

Glycerine (best).....3 ounces.
Balsam of Peru.....½ ounce.

The mixture is to be stirred until nearly cold, and then poured into pots. [Instead of balsam of Peru, 12 or 15 drops of otar of rose may be employed.]

Balsam of Honey.

Take fine pale brandy.....4 ounces.
Glycerine.....1 ounce.

Mix by a gentle heat; when cold add

Alcohol.....1 ounce.
Essence of ambergrces.....6 drops.
Citric acid.....3 drachms.

This is intended to remove freckles and discolorations, as well as to improve the general appearance of the skin.

Cold Cream.

Take white wax } of each.....1 ounce.
Spermaceti }
Oil of almonds.....¼ pint.

Melt, pour the mixture into a Wedgewood mortar which has been heated by being immersed in hot water; add gradually

Rose water.....4 fl. ounces.

and stir until an emulsion is formed, and afterward until the whole is nearly cold. Put in pots. It may be perfumed with bergamot or lavender.—*Druggists' Circular*.

Mechanical Hints.

OILING NAILS.—Every one knows the difficulty experienced in driving old nails into hard wood—it may not be so generally known that moistening the point with spit-tle or, better still, with oil, will enable one to drive them much more easily. Again, old nails soon become loose when driven into soft wood; this is caused by the rust which acts also upon the wood, rendering the fibre brittle or rotten. To prevent this, place the nails for a few minutes in hot grease, which will penetrate under the scales of the rust, and if the nail is soon after excluded from the air by being driven into wood, it will effectually arrest the rusting process, and it will hold as well as a new nail—moreover it drives much easier. Anything which is kept from the air may be preserved almost indefinitely. When nails are driven, it is economy to paint over their heads, when it will not pay to paint the whole surface—the paint excludes the air.

TO PREVENT THE CRACKING OF WOODEN INSTRUMENTS.—Put them in a vessel of melted paraffine, and keep the temperature of boiling water until the air bubbles cease to escape from the pores of the wood. Then as soon as cooled, sufficient to handle, rub briskly, while yet warm, with a dry cloth.

TO CLEAN A GUN.—First take the barrels off the stock; then take enough vinegar to fill the barrels, and heat it boiling hot; pour it into the barrels, and let it stand until it stops foaming over at the muzzle, letting some run through the tubes; then take the cleaning rod and rub the inside of the barrels; then take water, hot enough to warm the barrels, and rinse out until the water is perfectly clear; then, with the cleaning rod, wipe the gun out perfectly dry, after which put a little sweet oil on a bit of cloth, and rub on the barrels, both on the inside and outside, and your gun is clean. The vinegar removes all stains and smut, and the water and oil prevent it from rusting, or hurting the gun in any way.

LIFE THOUGHTS.

A BLUSH is the complexion of virtue. MORE men fail for want of energy than for want of ability.

THE crown of all real manliness—of all Christian manliness, is purity.

SEE the sack open before you buy what is in it, for he who trades in the dark asks to be cheated.

THINK before you speak, and you will never be mortified with yourself, nor cause a thrill to flush through the face of a friend.

HE that can please nobody is not so much to be pitied as he that nobody can please.

ONE of the most important rules of the science of manners is an absolute silence in regard to yourself.

HAVE frank explanations with friends in cases of affronts. They sometimes save a perishing friendship; but secret discontent and mistrust always end badly.

VIRTUE.—Without virtue there can be no true happiness; but we want love joining with virtue to give us all the good which this world is capable of bestowing.

A BENEVOLENT HEART.—The best heater to resist winter with is a benevolent heart. Those who have tried improved stoves and failed, will please to remember that a load of wood given to a poor person warms you almost as much as it does him. Try it.

OATHS are vulgar, senseless, offensive, impious; like obscene words they leave a noisome trail upon the lip, and a stamp of odium upon the soul. They are inexcusable. They gratify no sense, while they outrage taste and dignity.

SATISFY YOUR CONSCIENCE.—Seek not to please the world, but your own conscience. The man who has a feeling within him that he has done his duty upon every occasion, is far happier than he who hangs upon the smiles of the great or the still more fickle favors of the multitude.

Life's Trials and Rewards.

Many persons are afraid of their trials. It would be wiser to fear their mercies. They are in more danger from their friends than from their enemies; from their comforts than from their crosses; from their health than their sickness. They often desire our prayers when they come into affliction, but they need them most when they are coming out of it, and are returning into scenes of danger and temptation again.

A holy life is made up of a number of small things. Little words, not eloquent speeches or sermons—little deeds, not miracles, nor battles, nor one great, heroic act or mighty martyrdom, make up the true Christian life.

Many men attend the Gospel to secure themselves reputation, business or friendship. This is trading in divine things. And what is the hope of the hypocrite, though he has gained, when God taketh away his soul?

Many there are who do not desire to be made whole, because being made whole would involve their losing their present position in society, they do not wish to part with their ungodly gains or wicked companions.

EARN YOUR DAILY BREAD.—Earn your comfort, earn your pleasure, earn your social blessings, earn your privileges as a citizen, earn everything you have by giving a fair equivalent for it. Be ashamed to hold anything that you have paid nothing for. Or, if you have been left property that you have paid nothing for, take it, and give an equivalent for it in the using.

LABOR.—It is to labor, and to labor only, that man owes everything possessed of exchangeable value. Labor is the talisman that has raised him from the condition of the savage; that has changed the desert and the forest into cultivated fields; that has covered the earth with cities, and the ocean with ships; that has given us plenty, comfort and elegance, instead of want, misery and barbarism.

GREAT MINDS.—Great minds had rather deserve contemporaneous applause, without obtaining it, than obtain without deserving it; if it follow them, it is well; but they will not deviate to follow it. With inferior minds the reverse is observable; so that they can command the flattery of knaves while living, they care not for the execrations of honest men, when dead. Milton never aspired to present fame, nor even expected it; but (to use his own words) his high ambition was, "to leave something to after ages, so written that they should not willingly let it die." And Cato finely observed, he should much rather that posterity should inquire why no statues were erected to him than why they were.

The New York Society of Practical Engineering.

This Society held its usual monthly meeting in their room in the Cooper Union Building, on Thursday evening, April 26. President, J. A. Whitney, in the chair.

Tensile Strength of Wrought Iron Rods.

Prof. Plympton read a paper giving the details of a series of experiments, which were carried on under his observation, to test the tensile strength of wrought iron rods, and also to determine their limit of elasticity. After giving a description of the testing apparatus, the writer made known the following interesting results:—

The breaking strain of wrought iron rods of from $\frac{3}{4}$ to $1\frac{1}{2}$ inches in diameter was from 40,000 to 57,000 pounds per square inch of cross section, the strength being slightly greater in the small than the large sizes. The limit of elasticity may be considered about three-fifths of the breaking strain. The extension of rods below the limit of elasticity for fibrous iron was one 180th of the length.

For strains below the limit of elasticity, the extension of the rod was proportioned to the strain. Above this limit, the extension increased in a higher and greatly varying ratio. The permanent set of every overstrained rod was its greatest length minus the extension it showed before the limit of elasticity was reached. The factor of safety usually employed is one-fifth the breaking strain, this being well within the limit of elasticity. It may be considered quite safe to test such rods, before using, to double the strain allowed in construction, or to two-fifths of the breaking strain. Under this limit of strain iron rods could last for ever, were it not for outside corrosion.

Determining the Amount of Water in Steam.

Mr. Leicester Allen then read an interesting paper on a method of determining the percentage of water held in suspension in wet steam, or steam delivered from boilers that prime. This peculiar method is based upon the fact that steam at 212° contains 1,178 heat units per lb., and water at the same temperature 212 units of heat per lb. Therefore, knowing the amount of heat issuing from a boiler in a pound of wet steam, the proportions of water and steam in the pound can be readily determined. The apparatus which Mr. Allen devised for this purpose, consisted of a scale beam with a platform at one end and a counterpoise at the other. On the platform was placed a copper vessel thickly covered with felt, this covering being surrounded by another copper can. A standard thermometer with large bulb is set in the inner or water chamber, and its shaft projects outside of the chambers with a very easily reading scale attached. A finely perforated copper pipe serves to induct the steam into the water chamber. In the bottom of the chamber is an escape pipe.

To use this machine, five pounds of water are placed in the chamber through a funnel pipe in the top. The water is then raised to a temperature of 80°, by admitting steam through the coiled induction pipe. The surplus water, added by condensation, is drawn off through the escape pipe, leaving in the chamber five pounds of water at 80°, containing 400 units of heat. A sliding weight is then set along the beam to 5½ pounds, and the steam to be tested is then allowed to flow in until the beam balances. Then the influx of steam is stopped, the thermometer is read, and the actual proportion of water held in suspension is determined.

GOLD IN BULK.—The Auburn Stars and Stripes of May 4th says: Last Sunday a Chinaman brought in and sold to Hubbard & Andrews a small slug of solid gold, about an inch wide, an inch and a half long, somewhat thicker than a twenty-dollar piece, weighing about \$23, which bore evidence on both ends that it had been chiseled or chopped with a dull instrument from a solid mass of the same material. For about 18 months different Chinamen have at irregular intervals brought in and sold to the same firm blocks of gold bearing similar marks, weighing \$40, \$50, \$100, and as high as \$200 each. Where they come from is a mystery, but there seems to be pretty fair grounds for believing that somewhere in this vicinity our Celestial friends have found a gold deposit such as most old miners have dreamed of, but which few have ever seen.

Sewing Machine Improvement.

A great objection has been urged against the use of sewing machines from the fact of their use being very detrimental to the health of the operators. It is for this reason that such persistent efforts have been made to devise some ready mode of operating these machines by the use of some other means than foot-power.

The Mill's Adjustable Treadle has recently been devised and applied to the Howe Sewing Machine, which is said to remedy the evil complained of by a simple modification in the manner of constructing and adjusting that portion of the machine. This invention has been brought to the attention of a large number of physicians, who appear to be unanimous in the opinion that what is claimed for it has been secured.

The peculiar feature of the new treadle consists in making the foot-board so adjustable, both vertically and longitudinally, that whatever the size of the foot or shoe, the true center of motion of the foot may also be brought to coincide with the center of motion of the treadle, and so held in place—thus permitting the feet to move on their natural centers, without having to overcome the weight and inertia of the heavier limbs. In another column will be found a certificate from no less than fifteen of the leading physicians of this city, expressing their opinion that the use of a sewing machine, with this treadle attached, so far from being prejudicial to the health of the operator, will be not only harmless, but positively beneficial as a physical exercise tending to develop the muscles of the lower limbs, strengthen the ankle and impart elasticity to the foot.

The authority referred to is the best that can be obtained—all, indeed, that could be asked, and if this improvement accomplishes the ends certified to the inventor, it ought to receive the warmest thanks of the community and a fortune besides. This improvement may be seen and examined at the Howe Sewing Machine office, No. 113 Kearny street, in this city.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

W. H. MURRAY—Eastern States.
M. B. STARR—Pacific Coast.
THOS. POYER—California.
WM. J. CLARK—California.
S. H. HERRING—California.
L. P. MCCARTY—California.
E. P. HICKS—California.
A. O. KNOX, City Soliciting and Collecting Agent.

FOUR MONTHS' SUBSCRIPTION FOR \$1.—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office. apl-bp-ft

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

TO THE MINING INTEREST.—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanic's Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL TO OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanics' Institute, care J. H. GILMORE, San Francisco.

THOMAS O'NEIL, Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Out Glass to order on reasonable terms. 14v20

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21st 70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4jy72, that he has paid to the 4th of January, 1872; 4j10, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publisher.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction.

Leather Market Report.

[Corrected weekly by Dolliver & Bro., No. 109, Post st.]

SAN FRANCISCO, Thursday, May 12.	
SOLE LEATHER.—The demand is still equal to the supply, and prices firm.	
City Tanned Leather, ½ doz.....	25 00
Santa Cruz Leather, ½ doz.....	28 00
Country Leather, ½ doz.....	25 00
French Calf and Kip Skins still continue firm, with a slight advance in price, and the best brands of Kips. Domestic Skins rule the same.	
Jodot, 11 to 19 Kil, per doz.....	\$82 00 @ 96 00
Conchellian, 16 Kil, per doz.....	12 00 @ 12 00
Oregon Calf, ½ doz.....	54 00 @ 54 00
Mercier Calf, 16 Kil, per doz.....	63 00 @ 63 00
Jodot, second choice, 11 to 15 Kil, ½ doz.....	88 00 @ 88 00
Common French Calf Skins, ½ doz.....	35 00 @ 35 00
French Kips, ½ doz.....	1 00 @ 1 00
California Kip, ½ doz.....	60 00 @ 60 00
Eastern Wheel Stuffed Calf, ½ doz.....	80 00 @ 80 00
Eastern Bench Stuffed Calf, ½ doz.....	1 10 @ 1 10
Eastern Calf for Backs, ½ doz.....	1 10 @ 1 10
Sheep Roans for Topping, all colors, ½ doz.....	8 50 @ 13 00
Sheep Roans for Linings, ½ doz.....	5 50 @ 10 50
California Russett Sheep Linings.....	1 50 @ 1 50
Best Jodot Calf Boot Legs, ½ pair.....	5 00 @ 5 00
Good French Calf Boot Legs, ½ pair.....	4 50 @ 5 00
French Calf Boot Legs, ½ pair.....	4 00 @ 4 00
Harness Leather, ½ doz.....	30 00 @ 37 ½
Hair Bridle Leather, ½ doz.....	48 00 @ 48 00
Skirting Leather, ½ doz.....	31 ½ @ 37 ½
Welt Leather, ½ doz.....	30 00 @ 50 00
Bull Leather, ½ foot.....	22 ½ @ 25

THE MOST

Important Improvement

EVER MADE ON

SEWING MACHINES

CAN BE SEEN IN USE AT THE

HOWE SEWING MACHINE OFFICE,

No. 113 Kearny Street.

H. A. DEM NG, Agent.

Read the following endorsement, signed by our most prominent physicians:
We, the undersigned, practicing physicians of San Francisco, having examined and witnessed the operation of

MILLS' ADJUSTABLE TREADLE,

for Sewing Machines, take great pleasure in giving our testimony to the great value of the improvement, in a sanitary point of view.

The peculiar feature of this new Treadle is that the Foot-board is made Adjustable, both Vertically and Longitudinally, so that whatever the size or shape of the foot or shoe, the True Center of Motion of the Foot may Always be Brought to Coincide with the Center of Motion of the Treadle, and held there, thus Permitting the Feet to Move on their Natural Centers Without Having First to Overcome the Inertia and Weight of the Heavier Limbs.

In our opinion it possesses the following important advantages over the ordinary Treadle:

First—It eases the excessive labor and waste of power consumed in keeping up the rapidly alternating motion of the lower limbs and body whenever the machine is run with any speed.

Second—It avoids the frequent and serious injury to female health resulting directly from that motion.

By the general adoption of this Treadle we believe the only serious objection to the foot-power sewing machine will be removed, and that so far from being prejudicial to the health of the operator, its use will prove as harmless and positively beneficial as other physical exercises, tending directly to develop the muscles of the calf of the leg, strengthen the ankle, restore the elasticity of the foot, and promote circulation in the extremities.

Signed,
H. H. TOLAND, M. D.,
President Toland Medical College.
G. HOLLAND, M. D.
H. H. HUBBARD, M. D.
J. CAMPBELL SHORB, M. D.,
Ex-Professor Physiology Toland Medical College.
C. M. BATES, M. D.,
Health Officer,
(Constituting the San Francisco Board of Health).

L. J. HENRY, M. D.,
WM. F. HALE, M. D.,
BENJ. D. DEAN, M. D.,
President Medical Society of City and County of San Francisco.
WM. T. GARWOOD, M. D.,
DAVID WOOSTER, M. D.,
R. BEVERLY COLE, M. D.,
Professor of Obstetrics Toland Medical College.
J. P. WHITNEY, M. D.,
Emeritus Professor of Physiology, University of the Pacific.

L. C. LANE, M. D.,
Professor of Surgery, University of the Pacific.
O. T. DEANE,
Professor of Disease of Women and Children, Toland Medical College.

I have carefully examined the new Treadle attached to the Howe Sewing Machine, and consider it a most valuable improvement, doing away with most of the motion of the back and pelvis, which is unavoidable in operating the old style Treadle, and which has proven so detrimental to health. I cheerfully recommend it to those who work much with Sewing Machines, believing it will save them much suffering.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLA-TING

P O W D E R,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the best blasting powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

O. MULLER, optician, 205 Montgomery street, stands first in his profession, and all those who suffer from defective eyesight should apply to him.

PACIFIC BRIDGE COMPANY,

W. H. GORRILL, OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

CAUTION AGAINST FAIR.

Declared by Connors-seurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.
Wholesale and for export by the Proprietors, Worces-ter; Crosses and Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, GROSS & CO., San Francisco. 1v22-1yow

Due to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Silver Sprout Mining Company—Loca-

tion of Works and Mines, Kearns District, Inyo County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment levied on the fifteenth day of March, 1871, the several amounts set opposite the names of the respective shareholders as follows:

Names. No. of Certif. No. Shares. Amount.
Gillig, John.....unissued 640 \$4000 00
Heart, George.....unissued 200 1250 00
Mott, E B Jr.....29 200 1250 00
Tuttle, B F.....31 60 375 00

And in accordance with law, and an order of the Board of Trustees, made on the 15th day of March 1871, so many shares of each parcel of said Stock as may be necessary will be sold at public auction at the salesroom of Man-riche Dore & Co., 327 Montgomery St., San Francisco, Cal., on Monday the 5th day of June, 1871 at the hour of 11 o'clock A. M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

Stock in this Company will be received in payment of the above assessment, at the rate of \$12.50 per share, U. S. Gold Coin. T. B. WINGARD, Secretary.
Office, No. 206 Front street, San Francisco.

Salamander Gold and Silver Mining Company, Leon's Ranch, Mill Valley District, Calaveras County, Cal.

Notice is hereby given, that at a meeting of the Trustees of said company, held on the 4th day of May, 1871, an assessment (No. 8) of Thirty-five cents per share was levied upon the assessable stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, F. J. Pfeiffer, at the office, No. 210 Post street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 15th day of June, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of July, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.

R. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco.

Stockholders' Meeting—Office of the

Rogers Silver Mining Company, San Francisco, May 10th, 1871. In accordance with a resolution adopted at a meeting of the Trustees of the Rogers Silver Mining Company, held this day, a special meeting of the stockholders of said company is hereby called, the same to be held at the office of the company No. 6 Montgomery street, San Francisco, California, on Tuesday, the 20th day of June, A. D., 1871, at 11 o'clock, A. M., to take into consideration, and decide upon the proposition to increase the capital stock of said company from nine hundred thousand dollars, divided into three thousand shares of three hundred dollars each, the present capital of the company, to fifteen hundred thousand dollars, to be divided into fifteen thousand shares of one hundred dollars each.

THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
it to stand any pressure required; its lighter than iron
pipe and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.

DARLING & CO.,

Importers, General Agents and Commission Merchants.

Machinery, Merchandize and Supplies of every description Purchased and Sold on

Commission,

AT LOWEST RATES.

General Agents for the

NATHAN & DREYFUS

SELF OILERS.

These Oil Cups are too well known
to require any lengthy description;
the following are the main points
of advantage.

We guarantee a saving of

75 PER CENT OF OIL.

They are composed of a transpar-
ent Glass Cap, mounted in Brass,
provided with a hollow tube, inside
of which is placed a loose acting
solid or hollow wire, which acts as
a Feeder and Regulator. The wire
rests constantly upon the Journal,
thereby acting with the bearing in
its motion. The wire is so regu-
lated inside the tube as to feed ac-
cording to the demand only. There
is no flow of oil whatever while the
machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' con-
stant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give
perfect and entire satisfaction.

DIRECTIONS.

Fill the Cup full of Oil, then screw the Cap down air tight. Place the tube in the oil hole in an upright position
or upon an angle of 45 degrees. Permit the Rod to rest upon the journal, and have a perfectly free action. If you
desire to have the oil flow faster, reduce the size of the wire.

Take Notice.

All persons are hereby cautioned against buying, selling or using any Cup with a wire resting upon the journal
that is not stamped with our name and date of patent, May 21st, 1867, as we shall prosecute all infringement, signed
NATHAN & DREYFUS, New York, Jan. 1st., 1871.

WE ARE ALSO GENERAL AGENTS FOR THE

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several im-
portant improvements have been made and two additional patents obtained
we feel justified in recommending it to all parties using Steam power, and
warranting it to be the most perfect
regulator in the market.

The Gardner Governor is so well
known that we think it unnecessary to
enter into a detailed explanation of the
principles involved, or details in its
construction, merely giving the leading
object realized by this important in-
vention. The Governor combines with
the greatest simplicity of construction,
accurate regulation of speed, posi-
tive insurance against all accidents
liable to occur from slipping or parting
the Governor or driving belts, and a
convenient arrangement for adjusting
the speed of the Engine while in mo-
tion, without change of pulleys.

The construction of the Governor is
extremely simple, having no springs,
inside joints, swivels or parts liable to
disarrangement, all the several parts
are duplicates of each other in the same
series; the most skillful workmen are
employed, the best material used and
the machinery employed especially
adapted to their manufacture. Thus

we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheer-
fully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either
BLACK OR FINISHED, as you may require. We are also Agents for the

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup
to the public, we desire to call
very particular attention to its
many special advantages.

FIRST:—Nothing but clean oil or
tallow is admitted into the Cyl-
inder, no lime or sediment of any
kind.

SECOND:—Its great economy of
both tallow and fuel.

THIRD:—It is self-acting, and
supplies the lubricating material
only while the Engine is in
motion.

FOURTH:—Its certainty and regu-
larity of feeding, and increase of
the power of the Engine.

The principle upon which this
apparatus is founded is that, in-
stead of admitting tallow into the
Cylinder in considerable quantities
at uncertain intervals by means of
oil cups, grease cups, and other
crude contrivances, and allowing
it to be instantly blown out at
the exhaust (as must necessarily be
the case), this cup, by its pecu-
liar action, delivers the lubricant

in drops into the body of the
steam, which thereby becomes
thoroughly impregnated or greased
before passing into the steam chest
or Cylinder; the consequence is,
that instead of falling to the bot-
tom of the Cylinder, as it does
when admitted through a tallow
cup (which passes the lubricant
from the bottom of the cup to the
Cylinder), it enters into the form
of minute globules, and hence the
whole of the internal parts of the
engine become regularly and con-
stantly greased. The result of its
action has been proved in a very
great number of cases to be an
enormous saving of tallow, a con-
siderable increase in the power of
the engine, a great saving in fuel,
and reduction of internal friction
to a minimum.

These Lubricators will save you
75 per cent. of the Lubricating
Material, and cost no more than
the common Compression Cups.

The above Goods are Sold at
Factory Rates.

For Price Lists or information address DARLING & Co., 629, Washington Street,

San Francisco, California.

Traveling Agent—R. K. COLCORD.

6v22eow-6m

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW
CUP." This is
a California
Invention, and the
BEST and
Most Eco-
nomical
Lubricator
in use. It
keeps cool,
and its op-
erations are
very readily
observed.
Send for
Circular to
W. T. GAR-
RATT, Cor.
Mission &
Fremont
streets, San
Francisco.

DESCRIPTION:—D, is a glass chamber which contains
the lubricant. C, is a valve, connecting with cup which in-
troduces the lubricant into chamber D. F, is the discharge
pipe for the lubricant, provided with an inverted siphon to
prevent steam from coming back from the steam chest or
steam cylinder into the instrument. E, a waste pipe and
valve for drawing waste water from the oil chamber before
re-charging the same. B, a valve and pipe to introduce
water under the lubricant for the purpose of expelling the
same; this pipe is connected to the boiler or steam pipe
therefrom. A, is a steam condensing pipe or vessel, to pro-
vide a full supply of clean and pure water for the ejector
of the lubricant from the oil chamber; the rapidity of action
being regulated by the valves B and C. 1618-17

WHY THE WILSON

Patent Steam Stamp Mill

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee
that the purchasers shall be under no expense for re-
pairs for TWELVE MONTHS, and guarantee the mill to
crush (regular work) One Ton Per Hour of the Hardest
Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains,
from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and
repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Hmhm," but call and investigate its
merits. One can always be seen at the Pacific Iron
Works.

Ten of these Mills are now in operation.
For further particulars address

FURMAN R. WILSON,

San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Sellers made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and sellers
for themselves, at the office, 229 Fremont Street,
San Francisco.

STEAM JET PUMP.

Blakslee & Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also highly
recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.

We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it oper-
ates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

SCIENTIFIC PRESS

AN ILLUSTRATED JOURNAL OF SCIENTIFIC AND INDUSTRIAL PROGRESS,
Mining, Mechanic Arts and Inventions.

DEWEY & CO.,
Patent Solicitors.

SAN FRANCISCO, SATURDAY, MAY 20, 1871.

VOLUME, XXII
Number 20.

Safety Boilers.

On our coast, especially in our mountainous mining regions, where freights are high and fuel often very costly, a boiler which is easily transportable and economical in the use of fuel, is a desideratum. The one here illustrated claims to satisfy these demands, and has been largely used with very general satisfaction.

In order to economize in fuel, high pressures are now very generally employed in the use of steam. Those of our readers who have read the articles on the subject, as they have appeared in the *Press*, will understand the reason of this. We may here briefly state that the economy results in this manner. The heat actually utilized is that imparted to the steam after its generation; consequently, the greater the heat used in increasing the temperature of the steam, compared to the heat used to generate the steam, the greater the proportion of fuel utilized. The pressure and the temperature of steam bear a direct relation to one another.

Hence the tendency is to get the highest possible pressure. This is limited, in practice, by the strength of the boiler. But the safe pressure for a large shell boiler is comparatively small, the disastrous explosions of such boilers have further lowered the public confidence in them, and others have been introduced.

Among the first thus introduced to obviate the danger arising from the use of old-fashioned shell-boilers, was the one here illustrated, which allowing of great economy in fuel, while being at the same time safe, from its ease of transportation, erection and removal, and from its excellent workmanship, has been extensively adopted.

Fig. 1. gives a sectional elevation, and Fig. 2 a front view, of the boiler. Fig. 3 shows the tubes placed in position, but

not set in the brick work; and Fig. 4, the iron frame which accompanies each boiler.

The water is contained in tubes, *a, b*, of wrought iron, placed in a slanting position over the fire. These are connected by a simple and ingenious arrangement, *c*, consisting of triangular castings, forming three-way bends, and held in place by clamps

till a new tube is obtained. If an increase of boiler capacity is desired, new tubes can be added on the sides and top, and the furnace enlarged by removing only the brick work on the top and on one side.

The communication between the tubes is made large so as to counteract the tendency of the steam to carry water with it and leave a tube partially empty, when a

man can set such a boiler, without even having seen one, from the drawings.

The tubes are tested, before leaving the shop, up to a pressure of 500 lbs. to the inch. There is no doubt but that such a boiler will carry safely a much higher pressure than an old-fashioned one. Even if a tube should burst, it could cause but little damage, and the break would immediately act as a safety-valve for the rest.

The manufacturers state that in some cases, through accident or carelessness, some of the tubes have become entirely emptied of water and heated red-hot, and that, while in this condition, they have been again pumped full of water without drawing the fire and without any accident. They also state that in ordinary practice they are able to evaporate from 8 to 10 lbs. of water to 1 lb. of coal, which is certainly very high economy. The boiler may be taken to pieces for transportation, so that no part is too heavy to be carried, if necessary, in mountainous regions. The boiler is certainly worthy of serious consideration. Pamphlets, price lists, etc., may be obtained from the manufacturers, the Root Steam Engine Co., Second Avenue, corner 28th street, New York city.

WILD GEESSE IN MONTANA.—The *Deer Lodge Independent*, of April 22d, says:—Yesterday the air was literally alive with wild geese migrating North. Our sportsmen had a lively

time in taking a few of them in out of the cold. Mr. Sam. Scott killed nine, five of which he brought down at one shot. Mr. Owens, who lives about a mile above town, killed seventeen. The wind was blowing very hard from the North at the time, and the geese made but poor headway against it. Mr. Owens was mounted on the hurricane deck of a cayuse, and kept up with them for some distance firing at and killing them as long as he followed them. He killed 13 in this manner.

and bolts. Upon the ends of each tube are screwed hollow cast-iron heads, each containing three circular recesses, in which are inserted vulcanized rubber rings, and upon these the three-way bends are secured. In case of accident to any one tube, it can be removed easily in a few minutes, and a new one inserted; or if an extra tube is not at hand, the tube can be removed, the circular opening in adjoining heads, which connect with it, closed by blanks, and the boiler continued in opera-

sudden demand for steam is made. Figs. 1 and 2 show the position of the steam drum, *z*, and of the safety-valve, *s*. In regard to the frame, Fig. 4, the relative heights of the standards are such that the tubes, when set, are inclined about 18° with the horizontal. The plate, *y*, forms a base for a wrought-iron smoke stack, and is provided with a damper. The iron frame serves to hold the brick-work firmly together, and is also a valuable guide for the mason. By its aid, an intelligent work-

MECHANICAL PROGRESS.

BURNT IRON AND BURNT STEEL.—This is the title of a paper read at a late meeting of the London Chemical Society, by W. Mattieu Williams. *Nature* for April 20th gives an abstract of it, from which we quote:—"Iron which has been damaged by reheating, or excessively heated and exposed after balling in the puddling furnace, is designated 'burnt iron' by the workmen. It is remarkable that no amount of heat applied to the iron in the blast furnace or in the early stages of the puddling process produces burnt iron. Burnt iron is brittle, its fracture is short and what is called crystalline, it has lost the fibrous character of good iron. If steel is raised to a bright red heat and suddenly cooled, it is rendered hard and brittle, but these conditions may be modified by the process of tempering; if, however, the steel be raised to a yellow or white heat, and then he suddenly cooled, it is no longer capable of being tempered by mere reheating. It is worthless for ordinary uses of steel unless it is again raised to a welding heat and rolled or hammered while hot, and then allowed to cool gradually. The fracture of burnt steel presents a coarse grain and a crystalline appearance. Careful investigation, however, shows something more, viz., that the facets of the aggregated granules have a more or less conchoidal form. The name of 'toad's eyes' has been given by practical men to these concavities. Mr. Williams found that a piece of burnt iron contained oxide of iron dispersed through the mass. A sample of burnt steel, however, investigated in the same manner as the iron, showed no indications of the presence of oxide. This, of course, was to be expected, as the carbon of the steel must, more or less completely, protect the metal from oxidation. That iron, when unprotected by combined carbon, should oxidise not merely on its surface, but through its whole substance, when exposed at a sufficiently high temperature and for a sufficient length of time to the action of the atmospheric oxygen, is not difficult to conceive, since the researches of Deville, Troost, and Graham have shown red-hot iron to be permeable by certain gases. In the case of steel, as Mr. Williams states, the burning is limited to the oxidation and consequent removal of the carbon, which takes place even at a low red heat. The permeability of red-hot steel by oxygen and carbonic oxide enables us to understand the process of the internal oxidation of the carbon. The 'toad's eyes' or conchoidal facets of the so-called crystals, Mr. Williams explains by supposing a piece of steel at the temperature most favorable to the rapidest endosmosis of oxygen and the exosmosis of carbonic oxide to be suddenly cooled, and the possible occlusion of the carbonic oxide to be arrested. The results would be a certain molecular disintegration and porosity of the steel presenting those conchoidal spots. This view is further supported by the fact that burnt steel may be cured by reheating and hammering, or rolling at a welding heat."

SAFETY DEVICE FOR WATER PIPES.—A new English device to prevent the freezing of water in pipes is thus described:—Weighted valves are so arranged that if left to themselves they will drop, shut off the supply of water, and empty the pipes. But being suspended from a small glass tube filled with water, they are supported until the tube is burst by the freezing of this water, when they fall and thus empty the pipes before the water in them can be frozen. The renewal of the glass tube when the weather moderates, costs but a trifle.

CUBAN ARTILLERY.—"The Cuban government has shown no little fertility of invention in producing such articles as were most necessary and could not be otherwise obtained. Their cannon are made from *raw hides*, which, incredible as it may seem, will, it is said, sustain fifteen or twenty pound discharges. In the manufacture of powder the Cubans have shown great ingenuity, having successfully used for this purpose the guano deposits in the caves frequented by bats. This process is the discovery of Senor Castello, a graduate of the Polytechnic College, of Philadelphia. From 150 to 200 pounds of serviceable powder are thus made per day."—*Iron Age*, May 4th.

CANAL BOAT PROPULSION.—The Legislature of New York has just passed a bill offering a reward of one hundred thousand dollars for the best device whereby "any motor other than animal power," may be profitably applied to the propulsion of canal boats. Commissioners have been appointed to test all inventions or devices offered during 1871-72. If the Commissioners grant only one certificate for a plan complying in all respects with the requirements of the bill, the owner of that certificate shall receive \$50,000. If they grant two certificates, No. 1 gets \$35,000, and No. 2 \$15,000; if three, No. 1 gets \$30,000, No. 2 \$15,000, and No. 3 \$5,000. After practical trials of the devices selected, upon the Erie Canal, a further sum of \$50,000 will be paid Nov. 1st, 1873, to the successful ones, in the same proportion as above; making the sum total of one hundred thousand dollars.

BEST FORM OF RAIL.—In an article referring to Mr. Bessemer's late remarks at the Iron and Steel Institute upon a standard rail-section, the *American Railway Times* says: "A pretty good type of the rail which modern practice has found valuable may be seen in that adopted for A. T. Stewart's road on Long Island. This rail is 4½ inches depth of section, 2½ inches width of head, 4½ inches base, 9-16 inch stem, and weighs 63½ lbs. to the yard. The joints are two fish bars 17½ inches in length, the pair weighing 16 lbs., and secured by four bolts and nuts. Something like this, with slight modifications, is the rail now in use on many roads with favorable results. A shallow rail cannot be well fished, and hereafter we hope to see no pattern adopted of less than four inches depth, while we believe four and one half and five inches are much better for trunk or other roads with large traffic. If we could get the united experience of some dozen or so of the best railway engineers and managers by an authoritative expression of their views upon this important matter, we might hope that in the course of a few years this rail question might be settled upon some sensible basis."

KRUPP AND RODMAN GUNS.—The *Artisan* is informed by Krupp's agent in New York that the largest Krupp guns used at the siege of Paris were 24-pounders, about six inches bore. The French forts were armed with the largest marine guns of the French fleet, but the accuracy of Krupp's twenty-four pounders soon dismounted them, piercing the casemates, and reducing Fort d'Issy to a heap of ruins. * * The penetrating power of a 15-inch Rodman gun, weighing 39,000 lbs., with 60 lbs. of powder, is equal to 26.80 foot-tons; while Krupp's 24-pounder gun, weighing only 8,000 lbs., and with only 15 lbs. of powder, is equal to 47.70 foot-tons. A ship armed with this light weapon would, it is asserted, be more than a match for any vessel with as many 15-inch guns on board as it could carry.

IMMENSE ENGINE.—The Southwark Foundry, Philadelphia, contains an enormous engine, the diameter of whose cylinder is 110 inches; stroke, ten feet; two fly-wheels of thirty feet diameter, and weighing each about ninety tons; main beam of four parts, each thirty-six feet from center to center of pins, and nine feet deep through center. Beam centers of wrought iron twenty-seven inches in diameter; main shaft twenty-seven inches in diameter. The total weight is estimated to be, without pumps, 1,500,000 pounds, and its capacity 15,000 gallons, or sixty tons pumped 300 feet high per minute. The beams and pins weigh about 210,000 pounds, and the other parts in proportion.—*Pittsburgh Iron World*.

LOCOMOTIVE REFORM.—This is the subject of a paper recently read by N. M. Forney, before the New York Society of Practical Engineering: "It therefore becomes a question whether it is cheaper to pay the interest on the difference of cost between the heavy and the light iron, or distribute the adhesive weight on more driving-wheels. Up to the present time, the great majority of American railroad engineers have decided that the former is the cheaper of the two. Coupling more than two pairs of wheels is very generally considered to be objectionable, and, with the exception of those roads whose grades would not admit of being worked in any other way, locomotives having six and eight wheels connected have, in this country, generally been abandoned."

SCIENTIFIC PROGRESS.

REGIONAL ELEVATIONS AND SUBSIDENCES.

Lieut. C. E. Dutton read a paper April 7th before the American Philosophical Society, upon the causes of change in regional elevation, in which he advanced certain views of his own in regard to the changes effected in rocks while undergoing metamorphism. Their specific gravity is undoubtedly changed; also their volume. If the volume is increased, there must be an expansion, and that can only take place in a vertical direction upwards. A decrease of volume would, similarly, occasion a subsidence. We quote from an abstract of the paper in the *U. S. Railroad Register*:

"If we were to assume a change in the specific gravity of 1,000 feet of rock to the extent of five per cent. we could account for a change of level of 50 feet, and a series of rocks as thick as the carboniferous in this State, would, with an equal amount of change, give an alteration of level equal to the average altitude of the North American Continent above the ocean. It is, of course, impossible to conjecture the depth to which metamorphic action may extend, though it is undoubtedly very great; at least eight or ten miles, and there might be no great improbability in supposing such changes to take place through a large portion of that depth at the same time. That the rocks far down below the surface take up under the influence of great pressure, aided no doubt by heat, large quantities of water, carbonic acid, sulphuric acid, &c., is manifest in the materials issuing from volcanoes and from thermal springs. Water and gaseous acids issue in such enormous quantities from volcanoes, as to constitute a large fraction of the entire mass delivered, indicating that the solid materials have become supersaturated with them, and the association is resolved as soon as they reach the surface of the earth, and are relieved of the pressure to which they have been subjected. The overflow of volcanoes would, it is suggested, be susceptible of a similar explanation. Let us suppose a stratum or two, situated a few miles below the surface, became softened or lightened by the combined agencies described, so as to be specifically lighter than the average mass of overlying rock. If a vent or fissure could be found, such a plastic mass would inevitably follow the laws of the equilibrium of fluids, and would not only rise up into the chasm, but overflow. Putting the problem into another form, the heavier overlying mass would sink into the lighter semi-fluid beneath, and drive it upwards. It is a well-known fact that the lavas are all of small specific gravity. * * * In a similar manner Lieut. Dutton sought to explain the intrusion of traps, trachytes and basalts. These rocks were probably lighter than those which originally overlaid them, and forced their way through weak places to the surface. The traps, basalts and porphyries—at least such porphyries as may be called intrusive—though they are unquestionably altered sediments, are for the most part amorphous, and not crystalline. They were evidently altered at a comparatively low temperature, and at no very great depth. They do not appear to affect the strata into which they are intruded, and withal, are less highly metamorphic than gneiss or marble. Water seems to have been the chief agent in their transformation, and they may have been forced upward in a soft condition, and upon being relieved of the pressure, parted with the greater portion of this water. The traps and basalts also exhibit many planes of cleavage, with very perceptible interstices, and these interstices would seem to be much wider than could be accounted for by the contraction of cooling. He stated that he had often noted this fact, and was decidedly of the opinion that the contraction of these rocks by loss of heat, could by no means account for the entire width of such planes of cleavage, and believed that it was in great part due to the loss of water, which had once rendered them plastic."

SUBTERRANEAN ELECTRICAL DISTURBANCES.—The following is from *Nature* for April 20th:—"A few minutes before and after the earthquakes of the 17th March last powerful positive electrical currents were rushing toward England through the two Anglo-American telegraph cables, which are broken near Trinity Bay, Newfoundland. Mr. C. F. Varley O. E., who informed us of the fact, broaches the nov-

el speculation that some earthquakes may be due to subterranean lightning. He imagines that as the hot centre of the earth is approached, a layer of hot dried rock may be found which is an insulator, while the red hot mass lower down is a conductor. If this conjecture be true—and there is plausibility in it—then the world itself is an enormous Leyden jar, which only requires charging to a very moderate degree to be equal to the production of terrific explosive discharges. The French Atlantic cable was disturbed at the same time, and so were many of the English land-lines, but the only observations as to the direction of the current were made by means of the Anglo-American telegraph cables. A number of Mr. Varley's charts about earth-currents were published in the Government Blue Book of 1859-60, showing that the direction of these currents across England was in a very notable degree determined by the contour of the coast, and that the same auroral discharges would often produce currents at right angles to each other in direction, in different parts of Britain."

PLANT REMAINS PRESERVED IN COAL.

We copy the following from a notice, in *Silliman's Journal* for May, of Mr. Lesquereux's chapter on coal plants in the report of the Illinois Geological Survey:—"We have here mention of the fact that plants are sometimes found in good preservation in the solid coal, as well as in the disintegrated form of mineral charcoal which often occurs between the layers of the denser coal. 'This [former] case is especially observable in a kind of hard laminated flint coal, obtained in Mercer county by Mr. H. A. Green [of the Survey], which bears on the horizontal surface of its crystalline lamellae, however thin they may be cut, the outline and nervation of leaves and branches of ferns and other vegetables of the coal; and these are so distinctly marked that the most delicate parts are as easily identified as those of plants preserved in shales. The great abundance of these remains shows that the whole mass of this coal, which is true coal and burns freely, is a compound of them. In shales, the leaves of ferns and other plants are sometimes finely preserved in the form of extremely thin layers of coal; while, in other cases, the carbonaceous matter has nearly disappeared, leaving barely enough to show the outlines of the fossil. In still other cases, we find larger or smaller fragments of the cuticle of plants, not completely altered to coal, of a reddish-brown color, and retaining considerable elasticity. 'The shales, according to the amount of vegetable matter mixed in them, and the depth at which they have been formed under water [?], are of a more or less dark color; whitish or yellowish, when of fresh water origin, and with few remains of plants; black and generally more homogeneous when formed in deep water, and baving, for a larger proportion of their compound, broken remains of organized beings."

FOSSIL SERPENTS FROM WYOMING.—In *Silliman's Journal* for May, Prof. Marsh describes specimens of reptilian fossils found by the Yale College party last summer, in the Green River Tertiary basin, west of the Rocky Mountains. Among them were the remains of several species of serpents, the first extinct Ophidians found in the interior of the continent, and with the exception of three species from the Eocene marl of New Jersey (sometime since mentioned in the Press), the only ones yet found in the country. Nearly all belonged to constricting serpents, closely related to the modern Boas of South America, although smaller and generically distinct. For the separate genus represented, Prof. Marsh proposes the name *Boavus*, "in allusion to the not improbable relationship of the two types."

MIVART ON DARWIN.—St. George Mivart thinks that the long-armed apes, or gibbons, are more probably the direct ancestors of man than the orangs or African forms of the anthropoid monkeys. He proceeds to give his reasons for this opinion in *Nature* for April 20th. But he closes with this remark:—"To prevent misconception. I may add that fully recognizing the truth of Mr. Darwin's appreciation of man's zoological position, which I have ever maintained and indeed labored to support, I none the less completely differ from him when I include the totality of man's being. So considered, Science convinces me that a monkey and a mushroom differ less from each other than do a monkey and a man."

CORRESPONDENCE.

Irrigation by Iron Pipes.

EDS. PRESS:—Serious as are the consequences to our State of another dry winter, it has certainly produced one good effect. It has thoroughly aroused our people, especially in the San Joaquin valley, to the vast importance of irrigation for our grain fields.

Of the many plans proposed and on foot for this praiseworthy purpose, all we have heard of up to this time are on the principle of a ditch, or canal, beginning at some suitable point on the Joaquin or its branches, and dng through the various portions of the valley where the water is to be distributed.

A different plan, which is in some respects peculiarly adapted to California, has been suggested to the writer by a friend, and appears to present certain advantages that make it worthy of examination and discussion, even if it should be considered, at first thought, too expensive to be tested practically. But we hope an accurate estimate of the expense of constructing such a system will be made by those who have the information necessary for that purpose, and that the scheme may prove to be entirely practicable, and if so, may at once be put in execution.

Here we shall merely give an outline of the plan proposed, that it may be examined by others, and approved or disapproved at their leisure.

Instead of a canal, with its ditches and sluices, this plan consists of a system of cast-iron pipes, similar to those used to supply our large cities with water. Let the main pipe be, say two feet in diameter, or larger, if necessary. Force the water into this pipe, as is usual in such cases, at some desirable point on the stream from which the supply is to be taken.

A steam engine and pump of sufficient capacity to lift the desired amount of water to the proper height, would perhaps best accomplish this object. Now if this plan is not too expensive and can be readily put in practice, observe its advantages.

We must first remember that the amount of water in California with which we can irrigate our fields, is quite limited, in comparison with the inexhaustible supply for the superb system of irrigation which has been in use for centuries along the valley of the Po in Northern Italy. In the latter instance, where lofty mountains stand on each side of a long valley, almost exactly as is the case with the valley of the Sacramento and San Joaquin, there are, in the lower portions of the mountains, large lakes which form such immense reservoirs of water as we cannot control for the same purpose in our valley.

Consequently it is a matter of the first importance to avoid all waste of our limited supply of water. If a canal is used, how much water must our thirsty soil absorb? How much will our dry atmosphere evaporate? Iron tubes will prevent this waste. With them there is no absorption, no evaporation. They will convey all the water drawn from our rivers to the point where it is to be distributed.

Again, they will take up less room than a canal and ditches. For that matter, all the main pipes can be buried, if need be, and thus all the ground through which they pass can be cultivated. They would not interfere with roads, and no bridges would be necessary.

Another convenience of this system would be hydrants in our yards and houses. The durability of the tubes would be one of the advantages, and though the original expense might be greater than for the canal system, the expense for repairs would be comparatively light. The work once completed would be lasting.

Other advantages will present themselves upon a careful consideration of the subject. At all events, it recommends itself especially for our sandy soils. Though these pipes should convey a smaller amount of water than a canal, rules could be adopted to irrigate tracts in rotation, so that the supply would be ample for all practical purposes.

The next question is, would such a system pay? If the system of iron pipes in our mountain districts pays so well for mining purposes, why should they not pay when applied to the wants of agriculture. And if it pays to bring water to a city by such a system, to be consumed, why

should it not pay when its supply is likely to double the yield, and more than double the profits per acre?

Will not some of your correspondents who is competent for the work, make an estimate of the expense of such a system of irrigation, and let us know, through your columns, whether the capitalists of our State would be justified in forming a company to inaugurate such a scheme? If practicable, an act of incorporation might be secured at the next session of the Legislature, and portions of our plains could be supplied with water by this means in the spring of '72. No doubt, all land owners and farmers of our valley would do everything in their power to secure the success of such a scheme, were it found to be practicable. Right of way for the main pipes could no doubt be easily obtained along the line of projected railroads. w. w. Fair View District, Stanislaus Co.

Bull Run District, Nevada.

EDS. PRESS:—Everything is looking satisfactory here now. The Ogden Company have commenced work on their lode, and the McShane Company have also started up. The Johnson mine is looking better than ever. It is situated on what is known as Johnson Hill, at an elevation of 8,778 feet above the sea, and about 300 feet below the summit of the hill on the west side. The vein pitches to the east at an angle of 45 degrees for some 40 feet from the surface, and then changes to a dip of 60 degrees. At the depth mentioned, it is wider than at the surface, and shows an abundance of good ore. It has regular walls, and is bounded by slate on one side, and by limestone on the other.

The Porter mine has been leased to Mr. Mott, of Sacramento, who has 12 men at work extracting the ore, and who will, we understand, employ 10 more in a few days. The ore will probably work \$400 per ton. Mr. Mott has a pack train, loaded with ore to be worked at Vance's mill at Mountain City, and will keep this train employed all summer carrying ore from here to Mountain City. It is said that Mr. Mott has also leased the Revenue mine, and will start in on it in a couple of weeks. Prospectors are coming in daily, and lively times are expected here this summer.

Bull Run Defended.

Our district has been subject to many inconveniences, as you know. There is one point, however, which I would now touch on, as it is an undesired evil under which we have labored. A certain class of men, pretending to be mining experts, have come hither, and, after visiting one or two mines, have gone away without further examination of what we have, and have given out unfavorable reports concerning the place. One person of the class was here last fall, and, after looking at the Blue Jacket and Found Treasure, returned saying that he did not wish to see any more. Now these men did not really see what we have, and are unqualified to give a fair judgment.

The decision against the two mines named, is open to much criticism. But let me give a short description of them. The Blue Jacket has a well-defined ledge, with regular walls. A shaft, sunk 59 feet on the vein, shows better ore below than above; and a drift, run in 90 feet from the bottom of the shaft, shows an abundance of rich ore all through the ledge, which is 20 feet wide. Of this ore, 50 tons, worked at Mountain City, yielded \$246 per ton; over 200 tons are now on the dump (this could not be removed last fall before the snow prevented pack trains from getting up to the mine); and thousands of tons are in the mine, of richer quality than that previously shipped.

The Found Treasure has been prospected to a depth of 100 feet by shafts and tunnels, with plenty of ore in sight, and 40 tons on the dump, which will work over \$800 per ton. The ledge is 8 feet wide, with good casings in both sides.

Now these ledges certainly promise a good return to their owners, and do not merit the decision against them. The great objection is that they are high up on the mountain, and therefore inconvenient of access by wagon; still they are excellent properties.

Several times within the last 12 months, "experts" have called here, but have made no fair examination. The miners of our district are at all times ready and willing to allow their mines to be inspected by any one wishing to do so; but they demand that just reports should be made.

BULL RUN MINER.

Bull Run, May 3d, 1871.

California Wagons vs. Eastern Wagons.

One of the most important questions of the day to California, is whether her mechanics can or cannot successfully compete with the mechanics of the Atlantic States in supplying the demand of the Pacific coast for farm wagons, carriages and other vehicles in common use, and for agricultural machines and implements generally. In considering and discussing this question, we propose to do so with candor and fairness to all parties interested, acknowledging in the first place, that as Californians our interests and sympathies are strongly with the California mechanics.

Before going into a close examination of the proposition stated above, perhaps we might as well state here the points upon which the California wagon-makers base their claim to the superiority of the California-made wagon over the imported, and consequently to the patronage of the people of this coast.

1st. That the timber used in the California-made wagons being almost wholly obtained from the Atlantic sea-board States, and a very large proportion of it of second growth, is much better than that used in the imported wagons, which is obtained from the western forests where the wagons are made, and which is well known to be from large trees of the first growth of timber.

2d. That even if the timber used in the wagons was of equal quality, which they deny, the California wagons, being put up in a drier climate, and of timber that has for a long time been subjected to the action of that dry climate, must necessarily be, and are, much more serviceable and more valuable than wagons put together in the comparatively damp climate of the Atlantic States. Especially so, if the wagons are to be used in the dry atmosphere, and dry and hot soils of California, Nevada, Utah, Montana, Arizona and New Mexico.

3d. That the experience of the California mechanics on the ground, and having come from, and having brought with them the skill and tact of, all parts of the world, has given them a better understanding of the special wants and peculiar necessities of the farmers and others who use wagons on this coast, and has the better prepared them to meet those wants and necessities in all that relates to the strength, proportion, adaptability and durability of wagons to be used here or in a similar climate.

Of the general correctness of the above claims we have no doubt; but leaving our readers to judge of this question for themselves, we will pass to the advantages upon which the Eastern manufacturers mostly rely to sustain them in the competition upon which they have entered for the wagon trade of the Pacific Coast.

Their better facilities, their close proximity to the raw material used, their larger and better organized shops, with all the most approved labor-saving machines, united with plenty of capital or moneyed means with which to operate, all directed by an intelligent head, for the accomplishment of a definite purpose, assisted and guided by extensive general experience. In all these respects, as things now stand, the Eastern manufacturers, undoubtedly have a great advantage over us.

The Opposite Picture.

To illustrate, we will reverse the relative positions.

Suppose that all the large Eastern wagon manufacturing establishments were broken up, their labor-saving machines destroyed, their now united and well-managed capital divided into thousands of parts, and invested in as many thousands of small shops and rude tools, located in the small towns and villages and cross-roads throughout the country; suppose that these shops and this divided capital were under the control and management of as many different mechanics, whose experience and business capacity were as limited and circum-

scribed as their business and means, and that they were compelled to buy all the material used of the nearest dealers and pay therefor the highest retail prices, and perhaps pledge the wagons to be built from these materials to secure the payment of the same. Were such the circumstances of our Eastern manufacturing competitors, would the wagon-makers of California have any fear of imported wagons? Would they not on the other hand see before them in the almost immediate future the great wagon trade of the Pacific Coast falling into their hands without a dangerous rival to dispute it with them?

The Extent of the Trade.

Did our mechanics ever think of the extent and value of this trade, embracing as it does all the States and Territories above named, with Oregon, Washington and Alaska on the north, and Lower California and other Mexican and South American States on the south? Did they ever think how much more destructive the climate of these Pacific territories is to wagons and all other agricultural machines which have to be used in the open air, than that of the Atlantic States?

A trade like this is worth making an effort to secure. And shall it be said that our California mechanics are too short sighted to see it; or seeing it, that they are not equal to the labor of securing and supplying it? But let us look once more to the relative positions of ourselves and our Eastern competitors. They occupy the vantage ground, and our position is truthfully portrayed in the picture we just above, in supposition, drew for them. Their capital, skill and energy are united, ours are divided. We cannot if we would, and we would not if we could, reduce them to our unenviable position. The only chance to get even with them and to become their successful rivals in supplying this great future trade of the Pacific Coast, is to do as they have done. Break up our little one-man shops by the wayside, unite our skill, obtain labor-saving machines, classify and economize our labor, command, and obtain, as we then can, unlimited capital, and first-class business capacity and experience to manage it.

Being in such a position, and in possession of equal facilities in these respects, united with the advantages of the points claimed above by our mechanics, would there be any need of fear as to imported wagons?

The Beet Sugar Interest.

The 600 acres of sugar beets at Alvarado promise a fair crop. The scanty rains will no doubt lessen the production; but the soil is a rich, dark loam and holds considerable moisture. Rating the crop at 20 tons to the acre and the sugar content at 8 per cent., we have 12,000 tons of beets and nearly 1,000 tons of sugar. Counting 3c per lb. profit, which is safe, we have \$60,000 profit on an investment of \$125,000.

The experience of one season gives assurance that our figures will not vary much from realization. Let it be understood that our friends at Alvarado are perfect masters of sugar-making. From the word "go," there has been no balk and no mistake in the working of their sugarie; and no sugar in the world excels theirs in public favor or in market valuation.

Between crops, the Alvarado sugarie is not idle. With small outlay, it has been temporarily converted into a refinery of crude imported sugar. That product is now in market and it is not excelled by any rivalry.

It may be mentioned that the Alvarado company is preparing to use Prof. Partz's economic plan for making sugar and for refining. Should this process prove a success, it will revolutionize the process and add to the glory of California invention.

The prospects for beets, at the Sacramento Sugar company's plantation, are not flattering. The Northers have so cut down the young plants that we are informed the company has abandoned 200 acres to other purposes. It is not known whether the company will put up sugar works this year or not; but Herr Erstein, the German Superintendent, is herein consultation.

The taxable property of Grass Valley, as shown by the assessment roll, is \$768,455.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, May 6th: Mr. Ray, proprietor of the Mountain mine on Red Mountain, is soon to push the work of opening up that property with vigor.... The demand for ore from Leviathan mine for the manufacture of bluestone at Dayton is constant and the profit such as to make it one of the valuable mines. Several large teams are kept running.... The shaft to connect the Silver Glance with the Monitor No. 3 works on the Tarshish lode, was commenced this week. It will be over 300 feet deep.... New riches are constantly opened in the Schenectady and Monitor No. 3 mines on the Tarshish lode.

AMADOR COUNTY.

GOOD RETURN.—*Ledger*, May 13th: The Kennedy mill after running fourteen days, was stopped and cleaned up. The result was a bar worth six thousand dollars, an average of fifteen dollars to the ton.

BELDINO MINE.—*Dispatch*, May 13th: A large amount of good looking rock has been taken out of a new mine near town, owned by Belding & Hatch, of Sutter Creek, and a portion is being hauled to the Mahoney mill for crushing.

CALAVERAS COUNTY.

LOWER RICH GULCH.—*Chronicle*, May 13: The battery on the Palomo, thirty-six stamps, is kept constantly employed. We are informed that the average clean up at this mine is \$4,000 per week. The Alexander mine, adjoining, is worked with profit. The stamps are never idle.

ANOELES.—The "Big mine" keeps twenty stamps crushing rock. The shaft is sunk over five hundred feet, the rock taken out averages well, and the mine is paying. The Sticks mine is being worked with flattering results. It is reported that the proprietor has concluded a sale of the mine and that it is to be transferred to the purchasers as soon as the rock out is crushed.

ENCOURAGING.—Bates & Co., in the old Mokelumne Hill Tunnel claim are getting first-rate pay. Fifteen dollars per day to the drifter is the average yield.

WHISKY SLIDE.—Hardigan & Co., proprietors of the quartz mine, have commenced the erection of a mill.

QUARTZ.—Swank Brothers, of Railroad Flat, have struck very rich rock at the depth of forty feet. The vein shows four feet in width and the ore sparkles with gold. The mine is on the Poe lead.

WATER OUT.—The Union Shaft Co., after weeks of labor, have drained their diggings at last. They commence taking out gravel as soon as a sump is sunk.

MACHINERY.—E. J. Reynolds, of Independence, is erecting machinery on the Fifield & Burkhardt mine near Railroad.

RAILROAD FLAT.—Cor. of same: The Wolverine commenced April 8th under the new proprietors. Up to May 3d, forty tons had been taken out. The first-class ore gives \$50 to \$60 per ton. The vein is large and easily worked.... Lewis Bros.' shaft is down 240 feet.... Thoss' arastra works splendidly.... It is said that the Sundermier mine is to have steam hoisting works.... Rock from the Invincible went \$23 per ton at Randolph's mill.... Buckeye is idle.... Anderson & Co. are doing well.

INYO COUNTY.

DEEP SPRING MILL.—*Independent*, May 6: Four bars worth \$407 were the product of a lot of San Juan ore left on the dump by a former operator as worthless. It assayed \$102.

ECLIPSE.—Forty-two stamps of the battery at the new mill are in position.

BULLION SHIPMENTS.—During the week ending April 22, there were shipped from the works of the Owens Lake Co. 482 bars weighing 39,420 pounds. During the week ending 30th, there were shipped from the Furnace of V. Beaudry, at Cerro Gordo, 1,925 bars of bullion, weighing 161,700 pounds.

KEARSARGE.—*Gold Hill News*, May 9th: The mill was to start up on Monday. A double rail track 2,000 feet long leads from the tunnel to the mill. The 60-horse power turbine works well. Six Wheeler pans have been added. The capacity is now 30 tons per day.

NEVADA COUNTY.

ENTERPRISE.—*Grass Valley Union*, May 13th: The Enterprise Co., working the claims at Buena Vista Hill 3½ miles east of Grass Valley, formerly known as the Shea mine, struck gravel on Friday. They

have four feet of gravel in sight, which prospects well.

LITTLE YORK.—*Transcript*, May 10th: The Little York Water and Mining Co., on Little York ridge, is doing an extensive business. The water is plenty and the Company has four sets of claims in operation, and the yield amounts to \$10,000 per month.

EUREKA TOWNSHIP.—Judge Caldwell, informs us that all the miners are at work and prospects are excellent.

MINING SALE.—Same of 13th: W. L. Tisdale has sold his entire interest, thirteen twenty-fourths, of the Star Spangled Banner mine to the company. The mill which has been shut down during the past week, will we understand be started up immediately for regular work. We understand that the sale of the Marietta mine, in Washington township is about concluded and that the amount to be paid is \$200,000.

OMECA.—*Transcript*, May 16th: This is now one of the liveliest mining camps in the State. There are ten claims in operation, and there is not an idle man in the place. The claims are yielding handsomely.

WEBSTER MINE.—*Grass Valley Union*, May 16th: The Webster had a "broken week" because of trouble with the boiler. Several days were lost. The clean up, however, was 78 ounces of gold, or about \$1,400, which gives a large profit. The gravel in the drift is looking as well as ever. Yesterday there was a panning out of \$8 to the pan.

EAST EUREKA Co.—This English company, which now owns the O'Connor mine, although its organization is not yet complete, has commenced work in earnest. The mill is to have 20 stamps, and everything will be first-class. The castings are the heaviest of the kind ever made in San Francisco. It will be ready for work by July 1st.

PLUMAS COUNTY.

NORTH FORK.—*Quincy National*, May 6: The Dutch Hill Co. have a good head of water, plenty of good ground and will make a big season's work. They picked up eight ounces last week in their ground sluice.... Ferguson & Wagner, have got the water running through their new ditch, and are working eight or ten men. The gold is coarse, and there's lots of it.... Benham & Co., near the mouth of Batte Creek, have completed their race, and expect to turn the river by the 1st of July. The low water this season will be advantageous to river miners.... The Carriboo boys—Orton, Hickman and the rest—are doing well.... Davis & Co., of Red Rock, have no water this year; but their ground is very rich, and they can afford to wait.

EUREKA Co.—We learn that the Co. are running twenty-eight stamps, and doing unusually well. The mine is looking splendidly, and prospects were never brighter. The first shipment for the season was made this week, and amounted to \$10,000.

GOOD QUARTZ.—Bidwell & Co., of Greenville, made a shipment, per last express, of \$4,000, the result of seven days' run of their mill. They have had twenty-two stamps in operation, and the rock, which is from the Union mine, paid about \$20 per ton.

ITEMS.—Elwell, Byers & Nave have disposed of their interest in the Seventy-Six quartz mine at Eureka, to John Parrott & Co., of San Francisco.... "Uncle" Johnny Radley, is getting splendid prospects, in regular old-fashioned "lead gold," in his claims near Butterfly Valley.

PLACER COUNTY.

FINE CLEAN UP.—*Herald*, May 13: Greene & Co. run 20 tons of quartz through mill last week and without cleaning their batteries took out \$8,000 in melted gold, making \$400 per ton. This makes some \$22,000 in gold taken from some 32 tons of quartz with this 4-stamp mill in less than ten days' work.

DUTCH FLAT.—Cor. of *Stars and Stripes*, May 11th: In 1868 Andrew Larson started without a cent to open the Central Claims on the "Big Blue" Channel. He has since put in two thousand two hundred feet of flume forty inches wide, and four hundred feet of flume forty-four inches wide, the latter in a tunnel which has been just completed through soft clay, with massive trap boulders, and so moist as to require the use of false timbers and a hoarded breast to work it at all. The tunnel is timbered with giant posts, standing on solid soils, the whole lagged with heavy lagging. This tunnel gives an additional fall of sixty feet, and his shaft at its head is crissed with strong timbers, then lined with planks and then again with sheet iron upon a portion. He will have a bank two hundred feet high which he will salute with five hundred inches of water from Hoskin's Dictator & Little-giant some time during this week.

COLFAX.—*Grass Valley Union*, May 13: Saturday they made their monthly clean up at the Rising Sun Mill after 22½ days crushing, and realized \$7,659. This, with five stamps. They have fifty tons of rock on the dump.

SIERRA COUNTY.

ITEMS.—*Sierra Age*, May 10: Mr. Kelly informed us on Tuesday that the Shamrock Co., at Fir Cap, took out about 100 ounces last week. About the same as the week before.... The Phoenix mill is at work again. There are 200 tons of good quartz at the mill.... The Bald Mountain Tunnel Co. at La Porte have struck gravel.

ITEMS.—Same of 13th: An old miner who has been prospecting in this county for years, showed us this week eight ounces of coarse gold which he got from some ground that he commenced to prospect this spring.... Beard & Co.'s reservoir at Eureka burst last week. The large body of water rushed down the hill, carrying all the logs and stumps with it in its course. This is a serious loss to the company in so short a water season as this is going to be.

Proposals will be received until 15th inst., to build a quartz mill for the Keystone Co.

TRINITY COUNTY.

DODOLAS CITY.—*Journal*, May 13th: Smith & Wallacs took out 200 ounces in their final clean up.... The high flume of the Tourat ditch across the mouth of Democrat Gulch, gave way Tuesday and is a wreck. It will cost \$1,200. The claims of Theodore & Crikard on Mahie's flat, have been paying \$8 or \$10 a day all this season, so far. Only one claim on Smith's flat has cleaned up yet—run out of fall—proceeds \$1,200.

TUOLUMNE COUNTY.

WORTH FINDING.—*Sonora Democrat*, May 13th: On Tuesday a company of Portuguese miners working a claim near Columbia found a piece of quartz containing gold. The piece weighed eight pounds in all, four and a half pounds, being gold and is worth fully \$1,000. The same claim had been worked by Capt. W. A. Eakin who recently sold it to the Portuguese.

YUBA COUNTY.

RICH CLEAN-UP.—*Marysville Appeal*, May 3d: The Smartsville Hydraulic Mining Co. yesterday sent down to this city amalgam, valued at \$54,000, the proceeds of a clean-up during the past week, after a run of between three and four months.

Nevada.

COPE DISTRICT.

MOUNTAIN CITY.—*Elko Independent*, May 12th: The shaft in the Eldorado mine is down fifty feet, showing a ledge five feet wide at the bottom. The pulp assay of the last 10½ tons taken out was \$225.93, and all indications are favorable. Eight men are kept at work sinking.

ELY DISTRICT.

STRUCK IT RICH.—*Record*, May 7th: Frank Brown and others, owners of a mine in the neighborhood of the Bowery, lately commenced work on it, and a little over one week developed a ledge as rich as anything in the District. A week ago \$100 would have bought any one's interest in the mine, but since then \$2,000 has been refused for a fifth interest.

BIO ASSAY.—Same of 11th: On Monday John Cahill showed us a silver button, three-fourths of an inch in diameter, which was produced from one ounce of ore from the Bowery mine. The ore assays \$14,677.55 per ton.

BULLION.—Wells Fargo & Co. shipped on the 6th by way of Salt Lake, for the Meadow Valley Co., bullion valued at \$9,382.66, and for the Raymond & Ely Co. \$9,463.27. Total \$18,845.93. On the 8th and 10th, for the M. V. Co., 8 bars value \$9,558.94; for the Raymond & Ely 11 bars, value, \$15,020.65; total, \$24,579.58.

EUREKA DISTRICT.

EUREKA CONSOLIDATED.—*Sentinel*, May 13th: This Co. will put their two new furnaces at work next week. When the five are in blast they will reduce 100 tons of ore to bullion every 24 hours. There is no district in America that is producing as much lead bullion as Eureka, nor are any of them producing as high grade in silver.

BULLWHACKER MINE.—This has been sold to Messrs. Bernard and Sharp for a larger figure than any mine has been sold for in the district. The original discoverers have kept their property and developed it, and now they get enough for a year of labor to enable them to live in affluence the balance of their days. The new owners will at once erect a furnace and put on a large force of men.

TILTON FURNACE.—The capacity will be 25 tons per day, which amount can be taken from the mine (the Home Ticket) by 15 men. The ore requires no assorting,

but is all smelted as it comes from the mine. The Hon. S. S. Tilton has made a fortunate investment.

JACKSON.—Ore has been found in the shaft lately opened southward, between 500 and 600 feet from the old works. It will not be long before the Jackson furnaces are again turning out bullion.

TELEGRAM, 15th: The "Silver West" furnaces were to-day purchased by the Phoenix Co., will undergo a thorough overhauling, and start up in ten days.

HUMBOLDT.

STARTED UP.—*Silver State*, May 13: The Stewart Mill, belonging to the Arizona Association, is again pounding away, after a suspension of operations for three weeks, during which time a new hoiler has been placed.

NATCHEZ.—We learn from Mr. Pierce that work has been resumed upon the Natchez mine in the East Range, five or six miles south of Dun Glen, with favorable prospects.

RELIEF DISTRICT.—Cor. of the same: This is 20 miles east of the railroad. Orena is the supply point. In the Central Pacific mine, at present only five men are employed, as the company have an immens quantity of ore on the dump ready for the reception of the mill, for which arrangements have been completed. The Green Stone Co. have a good prospect, but go slow; only two men at work. The Hidden Treasure is owned by Samuel Grass & Co. They have run a tunnel 30 feet, and struck a fine ledge five feet in width.

REESE RIVER.

LANDER HILL.—*Reveille*, 13th: The richest and largest body of ore ever found in Lander Hill has just been laid bare in the 250-foot level of the Oregon shaft of the Manhattan Co. Some miners who took a contract to run a level of 50 feet, started at a point where no ore was in sight, but soon struck a 3-foot ledge of \$600-ore which has maintained its size and richness to the end of their contract.

NYE COUNTY.—*Carson Register*, May 10: Hon. M. R. Delano and his two partners have bonded their mine for sale August 1st for \$15,000, after refusing \$10,000 in cash. In case the bondee fails to come to time, another company stands ready to put up a mill for a half interest. The ore mills over \$100 per ton, and there are 1,000 tons on the dumps.

WASHOE.

CHOLLAR-POTOSI.—*Enterprise*, May 14th: During the week there have been extracted 1,810 tons of ore, and 1,711 sent to the mills. The average assay has been \$65.20. The company yesterday shipped \$38,000 in bullion.

YELLOW JACKET.—This mine is yielding 180 tons of ore per day, which assays \$35 per ton. A new incline is being started on the 1,100-foot level. The mine is yielding well throughout.

BELCHER.—The Co. are still engaged in opening and retimbering the drift to the northward on the 850-foot level.

CONSOLIDATED VIRGINIA.—Fair progress is made in the drift north from the main west drift, though they are in very hard blasting rock. The water having decreased, they commence drifting south toward the Gould and Curry from their main west drift.

SUTRO TUNNEL.—The Tunnel was in yesterday 1,963 feet. The ground has been very hard.

BUCKEYE.—The Co. are pumping out the old lower works. The Franklin mill is running to its full capacity on ore from the upper level.

SIERRA NEVADA.—This is still lying idle. The injunction suit brought by the Kenosha Co. will come up for hearing on the 29th instant.

SAVAGE.—On the lowest level raises from the cross-cuts are pushed upwards rapidly, to prospect the vein between the ninth and tenth levels.

OVERMAN.—The Co. are taking out 35 tons of ore per day which is crushed at the Devil's Gate mill. The ore is coming from the 226-foot level.

HALE AND NORCROSS.—Preparations for sinking the incline below the present lowest level are being made. The east drift from the bottom of the shaft is being run to connect with the top of the proposed incline. The yield of ore for the past week has been 175 tons per day, principally from the eighth level.

GOULD AND CURRY.—The sinking of this main shaft will soon be commenced. The prestige attached to the name of this mine is causing attention to it from our monetary kings.

JUSTICE AND INDEPENDENT.—Under the new management 25 tons of ore per day have been taken out from this mine for the past six weeks, through a tunnel 600 feet in length, which starts in Gold Canyon,

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING APRIL 25TH.

GRAIN SEPARATOR.—Daniel Best, Yuba, Cal.

WASHING MACHINE.—Henry A. Gaston, San Francisco.

EARTH-AUGER.—Thomas Orchard, Sacramento, Cal.

REFINING SUGAR.—August F. W. Partz, Oakland, Cal. Antedated April 22, 1871.

LUBRICATOR.—William Eaton Phillips, Silver City, Idaho Ter.

RAILWAY-SWITCH CHAIR.—Geo. H. Scougale, Carson City, Nev.

STORE-TRUCK.—Andrew V. Smith, San Francisco.

FIRE-KINDLING.—John W. Still, San Francisco.

BLASTING-FUSE.—Richard Uren, Santa Cruz, Cal.

FOR THE WEEK ENDING MAY 2D.

CARPENTER FOR AIR AND GAS.—Louis Marks, San Francisco, Cal.

SAND-CAP FOR HUBS OF VEHICLES.—George H. Nevens, Livermore, Cal., assignor to himself and R. N. Caughell, same place.

HYDRAULIC APPARATUS.—Phineas Franklin Powers, Genoa, Nev.

GARDEN-SPRINKLER.—John I. Spear, San Francisco. Antedated April 27, 1871.

ROLLER-SKATE.—Peter R. Borein, San Leandro, Cal.

DIVISION-PLATE FOR COOKING-STOVES.—S. C. Ewing, Hill's Ferry, Cal.

SECURING DENTAL FILLINGS.—Charles H. Mack, Portland, Oregon.

WASHING FLUID.—Edward Henry Neill, San Francisco, Cal., assignor to himself and Emlen Painter, same place.

ORE-CONCENTRATOR.—William C. Stiles, Nevada City, Cal. Antedated April 22, 1871.

TEA.—C. Adolphe Low & Co., San Francisco, Cal.

REISSUES.

PISTON-PACKING.—Orrin Collier, Sacramento, Cal. Patent No. 98,232, dated December 28, 1869.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

GRAIN-SEPARATOR.—D. Best, Yuba, Cal. This invention consists in a series of peculiarly shaped screens, to separate and clean the various qualities of grain, and in the use of feeding and returning elevators, by which the grain can be fed to the hopper with very little labor, and by which it can be returned to the hopper for a second cleaning, if required. The discharge spout for the second quality of grain is so arranged that it will either discharge the material immediately or return it to the returning elevators. The first quality is allowed to fall upon a screen which has a peculiar tossing motion and throws the grain into the discharge spout, or (by reversing the driving pulley) retains it as long as desired. A set of angular plates is introduced between the screens, and by their action and the shape of the screens the blast is directed upward instead of backward.

LUBRICATOR.—W. E. Phillips, Silver City, Idaho Territory. Among the new lubricators offered the public, this one from Idaho appears to be worthy of a high place. The lower part of the cup is so arranged that the oil must drop from it through an open space, allowing the feed to be easily seen. The feed pipe has a spiral or other suitable shape, with its center in a line with the center of the shaft, and takes oil from the cup at that point. Its outer end connects with the crank pin so as to lead the oil to the interior of the pin, whence it passes through small holes (or is led in other suitable manner) to the journal of the box at the crank end of the pitman or connecting rod. Thus the oiling of the crank pin is effected

BLOOMER CUT.
172 miles from San Francisco—Altitude 1,252 feet.

without danger or trouble or stopping the engine, by the centrifugal force imparted by its revolution.

RAILWAY SWITCH CHAIR.—G. H. Scougale, Carson City, Nevada. This invention consists in the use of a series of blocks of different lengths, which are shaped like a section of a rail, and so fitted in the chair that different lengths may be obtained, and by this means an adjustment can always be had to accommodate the expansion and contraction of the rails, or the creeping of

AMERICAN RIVER, Cape Horn.
198 miles from San Francisco—Altitude 3,800 feet.

a line of rails when placed on a grade, so that it will not be necessary to cut the rails frequently, as is now the case.

STORE TRUCK.—A. V. Smith, S. F. Mr. Smith's invention relates to the improved construction of the trucks which are used about stores and wharves. It is an ingenious arrangement by which the truck is held firm and prevented from rolling back when the front is depressed to receive a load; and, moreover, the parts are so arranged that the truck can be easily stopped and held on an incline.

FIRE-KINDLER.—J. W. Still, S. F. Of this fire-kindler, called Cooo Pino, we have already spoken at length.

Editorial Notes Eastward.—2.

Sacramento to Dutch Flat.

Leaving spunky little Sacramento, we are fairly started on our trans-continental journey. We pass the workshops of the Central Pacific Railroad, where busy industry holds sway, the hospital of the company, founded on a wise benevolence worthy of wide emulation, and cross the long bridge over the American River whose waters we shall again see under the most varying conditions of natural wonder and beauty.

It is not long before we get in among the mountains and ravines and around sharp curves and up steep grades.

CAPE HORN.
197 miles from San Francisco—Altitude 3,800 feet.

Ninety-four miles from Sacramento, we are passing through a deep cut, the so-called Bloomer Cut, at an elevation of over twelve hundred feet. Up we go, past villages and towns, and over bridges, with doubled engines, until we suddenly meet an apparently impassible barrier, a deep, wide abyss in which rushes the American River. Yet we must somehow or other reach that opposite hill, and while we are thinking of the possibility or impossibility, the train has been curving along one side of the

wondrous grandeur of the spot, where we might stay for days and weeks without danger of satiety. Yet we really see more than we are aware of, for afterwards we collect the stray fragments of the scene in memory, and find the picture more complete than we thought in our first moments of dazzled rapture.

Nevertheless, the more we memorize on the view, the stronger grows our desire to return to the place when we find a "convenient opportunity," an opportunity which there is too much danger of never coming.

But a few moments elapse, and we are among the scenes of mining industry. We have previously seen evidences of like operations on the road,—ditches coiling around the hillsides, and large piles of gravel. At Gold Run and Dutch Flat we see more of this. The deep wounds in the earth gape at us, and present no beauty, except perhaps to the very practical mind. It is pleasing to think of the vast treasures lying in the earth, yet to be taken out by man, and of the riches already accumulated. Still a picture of the work is more sightly than the reality.

The orchards and gardens which exist at these places, many of them really fine, lend no slight adornment, and suggest the idea of how much more can be done in this way to improve our mining towns.

D.

NARROW GAUGE RAILROADS.—We have received a copy of the report of the Joint Committee of the Massachusetts House of Representatives on narrow gauge railroads. We have previously given extracts therefrom. We here condense a few items about narrow gauge roads which have been built. Festiniog road, Wales,—gauge, 1 ft. 11½ inches; 30 lb. rails. Another road in Wales has 2 ft. 6 in. gauge and is eight miles long. Brölthol road, connecting with the Cologne and Gies-sen R. R., Prussia,—gauge, 2 ft. 7 in.; 22 to 26 lb. rails. The Thond-gan Railway, in Norway,—built in 1864; gauge, 3 ft. 6 in. Other roads have been built in Norway, Russia, Queensland and South America. Unaio Valenciana Rail-way,—15 miles long; 40-lb. rail. In the mining districts of Pennsylvania are several 2 ft. 6 in. roads. In Canada, 400 miles of 3 ft. 6 in. road are projected, of which 150 miles are under contract and about 15 miles

HYDRAULIC MINING, Gold Run.
202 miles from San Francisco.

in operation. In Australia, 250 miles are built and 250 more projected, of this gauge. On these roads the curves occur up to 255 feet radius, and grades up to 169 feet to the mile. The engines vary in weight from 7 to 15 tons. The Report says in conclusion:—So well satisfied is your Committee of the value of this improvement in railroad science, that they feel obliged to go a step farther with their report, than merely to present the facts upon which their conviction rests. They feel it their duty to propose, even at the expense of a partial deviation from legislative usage, enactments, even if of only a provisional character, which shall be sufficient to enable communities to avail themselves of the improvement during the present year.

POPULAR LECTURES.

The Study of Modern Languages.

[Prof. Paul Pioda before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Fifth Series. Reported expressly for the Press.]

LECT. I. May 13. Prof. Pioda, in commencing his lecture, remarked on the varied aspects under which language could be considered. It is the vehicle of thought, allowing of the communication and expression of ideas and facts. But in addition to its connection with the present, it is also connected with the past, with the whole history of the human race; it is a link joining together every tribe and nation; it shows the relations between the most distant peoples. The study of the languages, of their changes and variations, of the similarity and dissimilarity of one with another, has enabled us to discover many new facts in the history of former nations, and has cleared up many obscure points; has opened up many new avenues of knowledge and has, through the recent works on philology, been raised to the dignity of a science.

Prof. Kellogg had pointed out, in previous lectures, the connection of the classics with the modern languages, and it was the province of the speaker to-night to dwell on the affinity of the chief modern tongues, and to show some of the advantages to be derived from their study. The practical benefits arising therefrom were, perhaps, nowhere better or more forcibly illustrated than in this cosmopolitan city of San Francisco.

This study is an excellent means of expanding the mind, is the only one, it has been said, which develops all the faculties at once. It is not merely the study of words, but also of thoughts, of facts and histories. Every idiom is a system of philology. We learn thereby of the present and of the past, and can form some judgment of the future. The study should be commenced early in life when the lingual organs are yet pliable; but on this necessity of early training in the modern languages, the Professor would dwell at length at a future time.

This study gives us a better knowledge of English, and is an indispensable auxiliary to a general education. The Professor remarked on the similarity of many modern languages which have the same origin to a great extent, but vary in the termination of words. He gave examples of this similarity and also of the positive identity of words in English and in other tongues. Languages, like men, are imperfect, and need the assistance of one another to complete themselves. Hence many words and quotations are transferred from one to another, being required to fill gaps, to express precise meanings, to denote particular objects, or for the sake of euphony. Many examples were given of this. In this connection the Professor compared the musical geographical names taken from the Spanish in our State, as San Francisco, San Mateo, Santa Cruz, Santa Clara, etc., with our rough, harsh American names, as Dogtown, Red Dog, Hangtown, Shirt Tail Canon, etc.

That language which is subject to the greatest number of changes of inflection is the best for analytical study. Now the English is very poor in this respect. A regular verb, for instance, has six, and an irregular verb seven changes; while in the Spanish and Italian, a verb can be conjugated throughout without a personal pronoun, the termination denoting all that is necessary. For example, "love" may be the 1st, 2d, or 3d person, the singular or the plural number, etc., while "amo" can be only one certain person, number or tense. The English is very deficient throughout in inflectional changes. It is, indeed, the only language which can be learned mechanically—without understanding its principles and theories. The Professor dwelt on these points, comparing English with other languages, and then remarked also on some of the superior points of our language.

The Latin and Greek are, perhaps, the best media to show the theory of grammar. The revival of their study did more than anything else to free the minds of men from the chains of the dark ages in Europe. They enter into many living languages and are without question of the highest importance. Their study, however, demands more time than can be given by the many, and belongs rather to a higher in-

tellectual course than the multitude can afford to take. The modern languages, however, show a more evident practical bearing, are found in general more interesting, especially to the young, and are excellent for training the mental faculties and expanding one's ideas. The Professor spoke fully on the importance of their study, showing how a knowledge of a new language teaches a new history, explains facts, gives a new point from which to view some of the important features of the world, enables us to judge more clearly of the character of a foreign nation, etc., etc. The works of such a man as Shakespeare, for instance, cannot be translated, but must be read, to be fully understood, in the original. Attention was called to the fact that the study of languages opened a field for women, for which they seem to have a peculiar aptitude. A language spoken by a woman is modified and smoothed down in its tones and sounds, and rendered more musical.

In concluding his lecture, which was well written and very interesting in its treatment of the subject, the Professor remarked that the lower the position a man holds, the greater is the practical advantage to him of knowing other tongues than his own. To the rich man it is more a means of finishing off his education and increasing the refinement of his mind, but to the people it presents special inducement which can be turned to practical every-day benefit.

An Immense Aquarium.

A company was lately formed in London, with a capital of \$60,000, to make at the northern end of the Crystal Palace (partly burnt down in 1868) an aquarium of large size, which is nearly finished. It contains all the successive improvements which experience has suggested since 1846. The aquarium is 312 feet long, and 20 feet high, and in width 53 feet in some places, and 35 in others. The public portions of the building consist of three rooms—a saloon, 184x16½ feet; a south room, 30 feet by 8½ feet; and a north room, 14 feet by 8½ feet. Besides these, there are a work room, a steam engine and boiler room, an apartment to contain the heating apparatus, two store rooms; an attendants' gallery running from end to end of the entire building, and an office.

There are 150,000 gallons of sea water, weighing 700 tons, of which 130,000 gallons are in a reservoir below the saloon, and 20,000 gallons are distributed among 60 tanks containing the animals. These tanks are of various dimensions and proportions, varying from 75 gallons to 4,000 gallons each, and ranging in depth from 6 inches to 6 feet of water, and therefore they will suit the requirements of a great number and large variety of creatures from sponges to fishes. The sea water is raised into these tanks from the reservoir below the saloon; and it flows through and among them, falling down a succession of levels, so that in its progress it may do as much work as possible, until it enters the reservoir from whence it came, and from which it is again and again pumped by steam-power, at the rate of from 5,000 to 10,000 gallons an hour, continuously day and night; and by means of this aerating motion, coupled with the oxygenation derived from growing plants, no change of water will be needed, and the quantity (brought from Brighton by Mr. Hudson) will be used year after year indefinitely, the loss of fresh water by evaporation being supplied weekly by the addition of an equal quantity of water distilled on the premises.

One novel feature in the undertaking is that most of the part of it are in duplicate. Thus, there are two steam engines, each of three horse-power, and especially arranged for continuous and economical action, two steam engine boilers, two pumps, and two distinct sets of receptacles for animals; tanks 1 to 38 being for the public exhibition of animals, and tanks 39 to 60 being not publicly exhibited, but intended to contain collections of creatures purchased when they are cheap, or at seasons when their transport by rail is easy. The use of this power in reserve in the machinery is so that if any accident happens to one part of it, the other portion is ready to take its place, and thus the uninterrupted motion of the sea will be so far represented.—*Iron Age*.

HOTEL CHANGE.—The Orleans Hotel, on Post street, this city, having passed into the hands of Mr. B. R. Boynton, is to be known hereafter as the Morton House.

COLORADO PAPER.—A late issue of the Colorado Herald was printed on paper manufactured at the Central City Paper Mill.

GOOD HEALTH.

Climates for Invalids.

The great advantage often derived by invalids from a change of climate is so apparent that a large amount of attention and research has been expended by Eastern writers on hygiene, to decide upon the best localities for invalids to resort to. A work upon this subject has recently been published by Wood & Holbrook, of New York, entitled "Climates for Invalids," which is very highly spoken of, both for the instruction it affords to invalids, and also for the general information it contains with regard to the surroundings and climatic conditions of the various localities recommended as a resort for invalids. According to the notices we have read of it, for we have not seen the work itself, it describes quite fully the various advantages possessed by different sections of the Atlantic and Mississippi States, and central portions of this continent; but makes no allusion to the Pacific Coast, which probably possesses more advantages in this respect than all other localities combined. east of the Rocky Mountains. Will not some one "write a book" showing the advantages of the various localities on this coast as a resort for invalids?

We have already, in previous issues, alluded to some of the advantages possessed by Los Angeles, Santa Cruz, and some other counties in this State, and it may not be out of place to give, in this connection, the following, which we clip from a late number of the *Atlas*:

Santa Barbara as a Sanitarium.

Dr. Brinkerhoff says that in eighteen years practice he has not known one case of diphtheria or scarlet fever. He has known three cases of dysentery of a mild type and an equal number of cases of membranous croup. He never heard of fever and ague originating in Santa Barbara. Sometimes patients came there with the disease. In all cases their cure is rapid and permanent. Santa Barbara has a singular immunity from small-pox when it prevails almost everywhere else. The doctor has seen three cases of small-pox, at wide intervals, which were cured with unusual dispatch. But the most marked exemption from disease is among children. They escape most of the complaints so fatal elsewhere. To account for this healthful record, the doctor refers to the presence of petroleum so extensively in the ground and in the springs which gush from the earth and cover the sea for many square miles with an iridescent oil of pungent odor. This mineral oil so taints the waters of that county that there is very little good drinking water to be obtained in wells. So volatile is this mineral oil that the air is everywhere imbued with it; and, like carbolic acid, it disinfects all miasmatic exhalations, while its own effluvia appears to be innocuous.

It may be mentioned that land thereabouts is held so far above the views of buyers as to invite few settlers.

WALK ERECT.—Walking erectly not only adds to manliness of appearance, but develops the chest, and promotes the general health in a high degree, because the lungs, being relieved of the pressure made by having the head downward and bending the chest in, admit the air freely and fully down to their very bottom. An erect position should be obtained by a effort of the will. The use of braces to hold up the body is necessarily pernicious; for there can be no brace which does not press upon some part of the person more than is natural, hence cannot fail to impede injuriously the circulation of that part.

PRESERVED MEAT.—Dr. Stein, of Dresden, while lecturing lately on the preservation of food, opened a tin canister of meat, preserved by what is known as Apert's method, and prepared by him in 1851. The meat, on examination, it is said, was found to be as fresh, and of as good a flavor, as when placed in the canister nineteen years previously.

LEMONS AND BILIOUSNESS.—As a general rule lemons are good for biliousness. Sometimes, however, the stomach is not in a condition to hear so strong an acid. In cases of biliousness the acid and sub-acid fruits should constitute a large part of every meal. There is nothing better.

Is it Air, or Something Else.

The entrance of air into a wound is the dread of the surgeon. When an abscess is opened he must prevent the air from mingling with the blood-clots if he would avoid putrefaction and its teaming accompaniment of animalcule life. Some eminent London surgeons inform me that they never squeeze an abscess, lest when the pressure is relaxed the air should be sucked in. Now, whence this dreaded power? Is it the air itself that causes putrefaction, or is it something carried mechanically by the air? A follower of Guy-Lussac would affirm the former; a heterogenist would refer the animalcules to "spontaneous generation;" a holder of the germ theory would ascribe the putrefaction to seeds or eggs floating in the atmosphere, and which, when sown upon the wound, sprout into this crop of minute organisms. Do any data exist which will enable us to say, with certainty, which party is right? I think so.—*T. H. Huxley*.

Professor Huxley takes the latter view of the subject, and believes air is poisonous to wounds because of the germs in it which grow. How much injury these germs do to the air-passages is not known, but no doubt these passages are not so susceptible of injury as fresh wounds. They are used to their presence to a certain extent, still they must do harm in the lungs, and who can tell how much?

BONES INFLUENCED BY FOOD.—M. Passillon, who has experimented on pigeons and rats with a view to determine the change in the composition of the bones, when fed on different kinds of food, reports to the French Academy that on analyzing the bones of the pigeons that had been fed with the strontia, there was found in a hundred parts of the ash of the bones:

Lime.....	46.70
Strontia.....	8.45
Phosphoric Acid.....	41.80
Phosphate of Magnesia.....	1.80
Residue.....	1.10
	99.80

The ash of the bones of the rats that were fed with the alumina gave:

Lime.....	41.15
Alumina.....	3.65
Phosphoric Acid, etc.....	51.95
	100.00

While in the bones of those fed with magnesia were found:

Lime.....	46.16
Magnesia.....	3.56
Phosphoric Acid.....	50.29
	100.00

A CURE FOR LOW SPIRITS.—Exercise for the body, occupation for the mind; these are the grand constituents of health and happiness, the cardinal points upon which everything turns. Low spirits cannot exist in an atmosphere of bodily and mental activity.

CAUSE OF POOR TEETH.—"What is the principal cause of the almost universally defective condition of the teeth of the American people? There is no country on the globe where the people suffer so much from poor teeth, and where dentists are so common as here. Among some nations, indeed, unsound teeth and dentists are unknown."

There are many causes which aid in destroying the teeth; as using very hot drinks and food, the use of saleratus, uncleanness, etc., but the principal cause is the feeding of children upon fine flour bread, fat, sugar, and other carbonaceous articles, to the exclusion of food that contains lime, phosphorus, silica, and other minerals in an organized form, which are necessary to the proper development of the teeth, and especially the outer covering or enamel. The system can not make something out of nothing, neither can it make sound, healthy teeth unless it has the necessary material supplied in the food. Fine flour does not contain the required material, while unbolted wheat meal does, and children who have plenty of the latter to eat will have good sound teeth.—*Herald of Health*.

CLIMATES FOR WEAK LUNGS.—In a great majority of cases a dry mountain atmosphere is best for weak lungs. The water should be pure and soft, and the temperature as nearly uniform as possible. The eastern slope of the Rocky Mountains—Montana, Wyoming, and Colorado—also Minnesota and Dakota, supply these conditions, and are the most desirable places for persons with weak lungs to spend the summer months.—*Herald of Health*.

Coaches. 315	

Notices to Correspondents.

ERIE CANAL.—P. R. Virginia, Nev. The Erie Canal is 363 miles long. It was completed in 1825 at a cost of \$7,143,789, when it was 40 feet wide at the surface of the water, with 4 feet of water, 84 locks, 90x15 feet, and had boats of 80-ton burden. The increase of business caused its enlargement. The dimensions now are: 70 feet in width at the water level, and 42 feet at the bottom; 7 feet depth of water at the shallowest points; tow-path, 14 feet wide; length of locks, 100 feet. The boats average 96 feet in length and 17½ feet in breadth; depth of hold, 9 feet; custom-house measurements, 120 tons on an average, but they carry about 230 tons in practice. When empty, they draw 2 feet of water, and when loaded to full capacity, 6 feet.

ACADEMY OF SCIENCES.—At the regular meeting, last Monday, there were presented by Captain C. M. Scammon, U. S. Revenue Marine, two specimens of bone of the Right Whale, taken at Onalaska Bay, Behring Sea, 1869; also one piece of bone of a Right Whale taken at Monterey, Cal., March, 1871. The main object of the meeting was to adopt a constitution, which was done.

SUTRO TUNNEL COMMISSIONERS.—The Commissioners appointed by the Government to visit and report upon the Sutro Tunnel are Dr. W. Newcomb, Gen. John G. Foster and Gen. H. G. Wright. Dr. Newcomb was recently a resident of Oakland. He is now of the Cornell University, New York, and was connected with the recent San Domingo expedition.

SAN RAFAEL MECHANICS' INSTITUTE.—We see that enterprising citizens of San Rafael have organized a Mechanics' Institute, which is a most excellent action. The officers are I. Shaver, President; H. A. DuBoise, Vice-President; U. M. Gordon, Treasurer; V. D. Shoub, Secretary; J. Sims and H. H. Butterfield.

REDUCTION WORKS AT CORINNE.—The Alger reduction works are in the course of construction at Corinne, Utah. Gen. Hefernan and Mr. G. W. Goff are the proprietors.

A RAILROAD is projected in Humboldt county, from Hookton to tide water on Eel river.

Concentration of Ores.

We see by the *Reese River Reveille* that Mr. Thomas Wren, formerly of Austin, but now of White Pine, will shortly introduce a process at Austin for concentrating ore. "Mr. Wren learned by experiment that in the ordinary rock breaker, the metalliferous portion crushed more readily and much finer than the barren quartz, and has consequently attached to such a breaker a system of screens, so that the valuable matter is separated from the worthless."

Mr. Wren was lately in this city, and tried a series of experiments which were conducted by Messrs. Riote & Luckhardt, of the Nevada Metallurgical Works, 21 First street. These gentlemen, who are excellently fitted for such tests by their superior experience, knowledge and ability, made the experiments with great care, and the results are equally reliable and interesting. We have obtained from them a few notes on the subject.

Samples of what is known at Austin as "Chloride ores" were first tested. This is a rock which is partially decomposed, and holds a decomposed mineral, in which there is considerable chloride of silver. The metalliferous part is brittle, and therefore separable by proper crushing from the harder quartz. We give three tests, which may be taken as representatives of the whole number made.

1st. Ore assaying \$43 per ton was crushed through ¼ inch opening. Of this, 50 per cent. passed through a No. 4 screen, and assayed \$50.27 per ton. The remainder, which would not pass the screen, assayed \$18.85 per ton.

2d. The same ore crushed in the same way; 39 per cent. passed through a No. 10 screen, and assayed \$61.26 per ton. The residue assayed \$32.98 per ton.

3d. Ore assaying \$28.26 per ton was crushed through ¼ inch opening. Of this, 40 per cent. passed through a No. 10 screen and assayed \$36.26 per ton. The residue assayed \$15.71 per ton.

The first test shows that one-half of the ore was increased 17 per cent. in value by this simple process; the second, that nearly two-fifths was increased 42 per cent.; and the third that nearly one-half was increased 36 per cent. The residues were subjected to a similar process and gave similar results.

These experiments are very interesting. There are large amounts of ore at Austin which is too poor to pay for treatment under present conditions. Yet by passing it through a crusher and over a screen, it would appear that about a half could be recovered of a value sufficiently great to make handsome returns; and the expense of this would be only a very small sum. The remaining half could again be treated in a similar manner to an extent to be limited only by the financial conditions of the place.

Similar experiments were tried with the sulphuret ores of Austin, but as the sulphurets are so finely impregnated throughout the quartz, no perceptible gain was experienced. The mineral must be of a nature different from the gangue and in bodies of proper size. The rock breaker merely takes the place of "cobbing" by hand, but it is infinitely cheaper and works on material which cannot be separated by manual labor.

In introducing such a process, the nature of the ore will demand that experiments should be made to determine the proper fineness of crushing and the proper size of the screens; while the cost of milling (which determines the paying value of the rock) and other purely pecuniary considerations will determine the extent to which it can be carried. As stated above, and shown by the experiments, only certain ores can thus be treated; but the process is applicable to an extent which will make it of great value to certain localities.

An Important Irrigation Enterprise.

An extensive system of irrigation is to be undertaken in the San Joaquin valley, by some of the leading men of this city. We to-day give a full record of the various canals proposed, as taken from the certificate of incorporation, which has been filed at the office of the county clerk in this city. The objects of the company in the construction of these canals is not only to provide water for irrigation, when and where needed; but also to afford means for transporting passengers and freight, and to furnish water power for farm and manufacturing purposes.

To accomplish this end, feeders will be cut from mountain lakes and streams to supply more directly and fully, water to the small lakes in the southern part of the valley, which will thus become immense reservoirs for supplying a portion of the proposed canals during the long, dry summers. Canals will also be run along the principal divides between the streams flowing down from the Sierras, which will be conveyed down into the main valley, whence, by branches, water can be carried to almost every quarter section throughout the entire eastern portion of the great San Joaquin and Kern river valleys.

To provide irrigation for the western portion of these valleys an immense main watercourse or canal will be opened from Buena Vista Lake in the southern portion of Kern county, skirting northwardly along the foot-hills of the Coast Range, as high above the valley as practicable, and passing through its entire length, until it reaches the San Joaquin at or near Antioch. The length of this main trunk will be some 230 miles, making reasonable allowances for the necessary sinuities. From this main trunk (which will also be used as a canal for transportation) lateral ditches will be constructed to convey water for irrigating the valley below. These ditches, when they leave the foot-hills will also furnish a large amount of water power before the water will be required for irrigation.

The scheme here presented is one of magnificent proportions; but none too great for the region of country which it is proposed to benefit. The capital stock is set down at five millions of dollars. Of course it is not expected that the whole scheme will be put through at once; but it is to be hoped that a commencement may be made this season, and that the work will be pushed forward as fast as practicable to its full completion. Its completion would create values equal to many times its cost in the appreciation of the land which it would benefit; as it would render possible a population in those valleys of from one hundred and fifty to two hundred thousand people.

We append hereto a more particular reference to the several canals proposed, as copied from the certificate of incorporation. Its perusal will enable any person having a good map of the State before him to trace out the lines of the canals, and form a very fair conception of the magnitude and completeness of the work proposed.

1. A canal leading from Kern river, at or near its westerly intersection with the north line of township 29 south, Range 28 east from Mount Diablo base, and meridian to Kern, Buena Vista and Tulare Lakes.

2. A canal leading from Buena Vista Lake, in Kern county, with a feeder from Summit Lake in Fresno county, and running along the west side of the San Joaquin valley to a point at or near Antioch, in Contra Costa county.

3. A canal leading from a point on King's river in Township 13 south, Range 33 east, Mount Diablo base and meridian, at or near the point where water is now taken out of said river for irrigating purposes, to Summit Lake.

4. A canal leading from a point on the south side of the San Joaquin river, at or near Millerton, to Summit Lake.

5. A canal leading from the north side of San Joaquin river, nearly opposite Millerton, along and near the base of the foothills as possible, to Bear Creek; the same to be conveyed by flumes, where

necessary, across the intervening streams, and to have branches between each two of said streams running westerly, for irrigating purposes.

6. A canal leading from the south side of Merced river, at or near the falls of said river, westerly, to the San Joaquin river.

7. A canal leading from the Tuolumne river, on its south side, at or near Lagrange, westerly to the San Joaquin river.

8. A canal leading from the Stanislaus river on its south side at or near Knight's Ferry, westerly to the San Joaquin river.

All the canals to be constructed with all the lateral canals and branches necessary for the purposes specified, particularly for irrigating.

Capital stock of five million dollars divided into 50,000 shares of \$100 each. Trustees:—J. D. Walker, T. Parrott, Adam Grant, F. D. Atherton, T. H. Selby, Milton S. Latham, Wm. S. Chapman, J. Friedlander, Alfred Godeffroy.

Sand-Caps for Hubs of Vehicles.

Mr. George H. Nevens, of Livermore, Alameda county, Cal., has invented an improved sand-cap for axle-boxes, which promises to be of excellent service in excluding all sand and dust, and which is easily applied to any wagon. We here give a simple illustration and description of the device.

The invention consists of a ring of metal which is made conical in form and has its smaller end attached to the axle near the collar. The edge of the larger end projects into a groove, which is formed in the inner end of the hub, and thus effectually protects the collar and axle-box from sand and dust. In the illustration, A is the hub of the wheel, B the axle, which may be fitted in any of the ordinary ways, C the collar, and E a ring of wood or metal, which may be put on by removing C. In

the case of axles already made, or in new work, the ring may be slipped on before the axle is welded up.

The metal cap, D, may be cast with the ring, E, if the latter is of metal; or, if the ring is of wood, the cap can be formed of sheet metal and suitably attached. This cap is conical, its edge entering a groove, a, in the end of the hub, as indicated. Its shape causes any sand or dust, that may fall on it, to slide or fall away from the hub.

The simplicity of the device is evident from the above, and its value must be very great everywhere, and especially great on our sandy, dusty plains. We recommend it to the consideration of farmers, miners and mechanics. A patent has been secured, through the SCIENTIFIC PRESS Patent Agency, to Mr. Nevens, who may be addressed as above.

Mr. R. N. Coughell, who owns one-half interest in this patent, will also be happy to give further information. His address is Livermore, Alameda county.

SHERMAN ISLAND CROPS.—The Sherman Island people claim that they will have the best crops of wheat and barley in the State—that the former will average 50 to 70 bushels to the acre and the latter 75 to 100. Moreover, after the grain has been taken off they will plow the land and plant root crops, thus realizing two full crops within the year—and both of the largest yield.

STAR SPANGLED BANNER MINE.—A correspondent writes us concerning the sale of the Star Spangled Banner mine, at Nevada, Cal. Thirteen twenty-fourths were sold for the sum of \$10,000.

INYO COUNTY INVENTION.—We see that the proprietors of our able exchange, the *Inyo Independent*, have invented a machine for printing addresses upon newspapers in wrappers. Our congratulations.

Artificial Limbs.

Simplicity of construction in all things is at once the greatest beauty and the best recommendation. In nothing is this more applicable than to the substitutes for lost limbs. That this is one of the great objects of the inventions here illustrated, is seen by an examination of the drawings, while it is also evident that utility, comfort and durability are likewise obtained.

The engravings represent artificial limbs which have novel features not heretofore obtained in them. India rubber is largely used in their construction, the feet and hands particularly being constructed of this substance.

Fig. 1 presents a full-length leg standing erect, to be applied in all cases where amputation occurs above the knee joint. Fig. 2 represents a leg to be applied where the leg has been amputated below the knee joint, and the stump is flexible enough and sufficiently long to enable the wearer to use it in walking. It also represents the leg

Fig. I.

gives all the motion required in walking, and also the ease, firmness, elasticity, and reliance, absolutely necessary in a perfect artificial leg.

It would seem at first sight that no one could walk well on any artificial leg, without the moving, flapping ankle-joint, but practice proves this to be erroneous. The rubber foot also gives all the required lateral motion to the foot when stepping upon sidling or uneven ground. This leg dispenses with all machinery of whatever character, and has been in use for a number of years, giving great satisfaction.

Fig. 5 gives a rear view of the knee-joint of the long leg (Fig. 1). The T joint is fastened to the upper part or thigh piece of the leg, and the gudgeons of the T are held in adjustable, oblique boxes, which are easily set at any time by the screws passing through the caps into the main leg, so as to keep the joint to work tight and still, yet free and perfectly flexible, the small projecting bar attached to the T with the button-shaped ball operating upon the spiral spring, so as to throw the foot forward when bent in walking, and so as to hold the foot under when bent at right angles in a sitting position.

Fig. 6 shows a rubber hand, made same as the foot, of which there cannot be as much said, as of the other inventions. It corresponds, however, with the others in

Fig. II.

Reducing Chloride of Silver.

We have, in the two preceding numbers of the Press, given a full description of the Miller process of refining gold by chlorine gas. To make the description complete, we now add a paper, written by Dr. A. Leibius, on his apparatus for reducing the silver chloride, which has been found of value as denoted in the previous articles.

In the refining of gold bullion by Miller's new chlorine process, the silver contained in the alloy thus treated is eliminated from the latter in the state of argentic chloride, which, by a subsequent process, is reduced to metallic silver.

This reduction has always been effected in the usual manner, viz., by placing the slabs of fused argentic chloride between plates of wrought iron or zinc, with the addition of acidulated water. Although a perfect reduction to metallic silver has always been achieved, yet it requires a considerable amount of time and manipulation, since the thick slabs of fused argentic chloride were, after two or three days, only partially converted into metallic silver, and had to be re-arranged in order to expedite their complete reduction. Such manipulations, however, were not only found to be very objectionable on account

vertical grooves, $\frac{1}{4}$ in. wide and $\frac{1}{4}$ in. deep, at intervals of $1\frac{1}{4}$ in. from each other. These grooves are cut down to a length of 12 in., leaving 3 in. of each board forming the legs of the frame.

At the termination of these grooves passes horizontally a narrow slit, $\frac{1}{4}$ in. deep, and along the whole length of each board, into which a strip of metallic silver, $\frac{1}{4}$ in. wide and the thickness of a three-penny-piece, is tightly fixed, projecting on one side of the frame about 18 in. beyond each board.

The seven grooves already alluded to are for holding zinc plates, $\frac{1}{4}$ in. thick, 14 in. long, and 12 in. high, which rest on both sides on the strips of silver, which, as just described, are jammed horizontally into the sides of the two boards. A connection is thus established between the seven zinc plates and these strips of silver.

The second part of the apparatus consists of a wooden frame, cut out of a solid board 1 in. thick, and supplied with two large iron handles. This frame is the same length as the box holding the zinc plates, but 3 in. narrower. It contains on each side, parallel to the direction of the zinc plates, twelve slits $\frac{1}{4}$ in. long, which hold silver bands $\frac{1}{4}$ in. broad and the thickness of a three-penny-piece. These silver bands are passed through the slits in the board, so as to form on each side of it six loops,

Fig. III.

Fig. IV.

Fig. V.

Fig. VI.

MARKS' PATENT ARTIFICIAL LIMBS, WITH INDIA RUBBER HANDS AND FEET.

with the heel compressed, and in its position after taking the step, and when firmly planted on the ground. Fig. 3 is termed a knee-bearing leg. It is to be applied where amputation takes place below the knee, and where the stump is too short or contracted at right angles, so that the knee joint cannot be used in walking. This figure represents the leg slightly bent at the knee, and bearing well upon the toe, as in the act of lifting it to take the next advance step.

Fig. 4 is a view of the india-rubber foot before being applied to the leg. This rubber foot constitutes the main feature in the legs shown in the figures. It is made mostly of india rubber of a very spongy, light and elastic character. A piece of willow wood, nearly filling the rubber heel at the top, or surface, where the leg rests, runs down about one-fourth of the distance towards the lower part of the heel; also forward and downwards to the joint at the ball of the foot, as shown by the dotted line. This piece of wood is the base upon which the foot is built, and is also the medium whereby the foot is joined firmly to the leg. The leg itself is made of light, tough willow in all cases, except the thigh piece shown in Fig. 2, and the front part of the thigh piece in Fig. 3, which are both made of leather. The entire leg and foot in all cases is covered with fine buckskin, neatly coated with a life-like, waterproof finish, making it both light and strong. It will be seen that there are no movable ankle-joints in these limbs, the necessity for these being entirely obviated by the elastic rubber foot, which

its characteristic features of simplicity and durability, and wholly dispenses with machinery, giving a softness to the feeling and an elasticity which is very desirable. It is as useful as any hand yet invented, which is not probably saying much in its favor, as no art yet shown, if it ever will, can compare with nature's handiwork.

These inventions have caused a great change for the better in the appearances, as well as usefulness to those who have lost natural limbs, and must give great relief to the maimed. In dispensing with so much machinery, they reduce the expenses of repairs very greatly, as there is no complicated gearing to get so often out of order. You see no part of the cuts representing the inside working of the leg, because there is none there to be exhibited, except the lower part of the knee spring, operating as described in Fig. 5. The limbs are, of course, hollow in all cases, to render them light, as well as adaptable to covering and supporting the stumps they enclose and sustain.

These limbs, which are protected by patents, are very popular and in great demand. Information concerning them may be obtained by addressing the manufacturer, A. A. Marks, 575 Broadway, New York City.

THE Builder announces that chignons, plaits and curls can be and have been made of spun glass, which, for cleanliness and other reasons, are preferable to human hair, hitherto used for that purpose.

of the time they required, but more so on account of the very disagreeable work which they caused to the operator. The reduced spongy silver was broken up by hand into small pieces, in order to ascertain its complete reduction, and was then boiled in acidulated water to free it from iron or zinc.

It remained, therefore, a desideratum to effect the reduction of the fused masses of argentic chloride in a manner which would, at the same, be quicker in its execution, and also obviate the just-alluded-to manipulations.

In 1863, Messrs. De la Rue and Hugo Müller, in London, constructed a galvanic battery, one pole of which consisted of fused argentic chloride the thickness of a goose quill, the other pole of cylinders of zinc. Adopting this principle, I have endeavored to construct an apparatus which should fulfil the requirements before referred to.

After operating successfully with a small model which allows the reduction of about 250 ozs. of argentic chloride in one operation, I have, with slight modifications, constructed an apparatus which will reduce from 1,400 to 1,500 ozs. of argentic chloride in twenty-four hours. The apparatus and its dimensions are as follows:

Two thick boards, 15 in. long, are joined together on both ends by three strong battens, so as to form an open box without a bottom, 13 in. long by 14 in. wide, and 15 in. high (inside measurement). The two boards forming the length of the box or frame contain seven

11½ in. in length and ¾ in. wide. The six loops on one side are exactly opposite to those on the other side of the board, at a distance of about 9 in. They are intended to hold the slabs of argentic chloride, which are 12 in. long, 10 in. high, and about ¼ in. thick, and are put through these loops lengthwise, projecting on each end about 1 in. beyond the silver bands.

The whole frame holds, as before stated, six of these slabs of argentic chloride, which are placed between the six spaces formed by the seven zinc plates, from which latter they are about ¼ in. apart on each side.

AN OLD STRIKE.—The Transcript, of Golden City, Colorado, said lately: Within a week or two, some miners in the mountains near Bear Creek, in this county, having sunk a shallow shaft five or six feet deep upon a newly discovered copper lode, found that the same place had been once before prospected and drifted. About five feet below the surface, in the detritus loose rock, charcoal and earth of the old pit, was an elk horn, partially impregnated with carbonate of copper, while the appearance of the bole plainly indicated some former mining operations.

RAILROAD EXTENSION.—The California Pacific have decided to build a road from Adalante, at the junction of the Napa Valley and Sacramento branches, to Petaluma, where it will connect with the Donahue road.

DOMESTIC ECONOMY.

PORK UNCLEAN.—The Divine declaration to the Jews:—"Swine is unclean, and of it ye shall not eat, neither you in your day, nor your posterity forever," undoubtedly had reference to the unfitness of such meat for the human stomach. *Scrofa*, from whence our word *Scrofula*, is the Latin for "an old sow;" and hence this terrible disease, even in the early Roman age, received its appropriate name from the belief that it was in some way connected with the hog. Lugol, in his essay on *scrofula* and its origin, tells us that it was originally derived from "sleeping with the hog!"

It is held by most that the command to abstain from pork was because it was in some peculiar way, at that time, a *Gentile* beast, and that the command has never been binding on Christian or Jew, since God told Peter, when he objected to eating all manner of meats (including swine), "What I have cleansed, that call thou not unclean."

But if we ignore that understanding altogether, it is certain that the cases of *trichinae*, which have recently become so common, ought to be of themselves sufficient reason to cause us to be extremely cautious how we partake of that kind of meat.

A SUBSTITUTE FOR OIL ON SALAD.—For people who dislike oil, the following preparation forms a very desirable and palatable substitute. The yolk of two hard-boiled eggs are rubbed very fine with a spoon; to these add a dessert spoonful of mixed mustard, mix the two thoroughly, then stir in a tablespoonful of melted butter, and half a teacupful of thick cream—salt. A dash of cayenne, anchovy or Worcestershire sauce will improve the mixture for some. Last of all, add, little by little, vinegar enough to make the whole a smooth creamy mass, and pour it on the lettuce just before serving.

HOW TO COOK ASPARAGUS.—Mr. Boots, of Alviso, furnishes the Santa Clara *Agriculturist* the following excellent receipt for cooking asparagus: In the vessel filled with nice unbleached "grass," he adds one-third full of water, and boils until it begins to get soft. He then turns off the water, which has absorbed all the rank green taste, and adds about half as much more water and boils until thoroughly cooked tender. He then adds cream or butter, and pepper to the taste. He has ready some dry toasted bread, a layer of which he places in the bottom of a pan, and covers with a layer of asparagus, then more toast and asparagus again until the dish is full—or completed.

CHOCOLATE—HOW TO MAKE AND USE IT. Take an ounce of chocolate for one person; scrape it and boil it about five minutes with about four tablespoonfuls of water. When smooth, add about a pint of new milk; let it boil, stirring it well. Buttered toast is the proper accompaniment of chocolate, or a light cake, made thus: Half a cupful of butter; one egg; two spoonfuls of cream of tartar, stirred with the butter and egg to a cream; one small cupful of *sour* milk added to this; three cupfuls the same size, of flour, sifted and well beaten into the liquid; and one small spoonful of soda, dissolved in hot water, and mix in the cake just before putting it in the oven, which must be hot enough to bake it in ten minutes. Bake in narrow cake-pans, filling them three inches deep.

POISONOUS CONFECTIONERY.—The official chemist of Dublin has recently made a report of 123 specimens of confectionery purchased at thirteen establishments in that city. Those manufactured at three establishments were pure, and those obtained at the other ten shops contained poisonous pigments and other impurities. Out of forty articles tinted yellow, only two were colored with saffron, all the others containing chromate of lead. Some of the specimens contained sulphide of mercury, or vermilion. There seems to be no doubt, it is stated, that these mineral colors act as slow poisons.

How I Wash my Dishes.

Of course, I make sure before breakfast or dinner that there is plenty of water in the boiler, and also in the tea-kettle. After the table is cleared, the table-cloth brushed off and neatly folded away, and the dining-room disposed of, I proceed with my dishes. First, I take my large dish-pan, put into it a piece of soap, and pour over the soap three or four dipperful of hot water from the boiler. Then I add two or three dipperful of cold rain water. Then my dish-cloth. The water should now be so cool as not to turn the hands red when put into it. Take the dish-cloth and rub from the soap the melted surface, and put the remainder away. Wash a dish at a time and pass it to another pan; a milk-pan is generally used. When all are done, or the pan is full, take the tea-kettle and pour over enough hot water to thoroughly rinse and heat them. Now take them from the water, one at a time, and place them bottom-side up upon a tray or pan to dry. If they have been properly washed, this hot rinsing water will run off or evaporate in a minute, leaving the dishes nearly dry. However, they should now be wiped with a clean dry towel, and put away. Dishes must be washed in soft water. Especially is this necessary where soap is used. And soap is really indispensable in washing dishes properly. The dishes should be scraped free from grease, crumbs, bones, etc., before commencing to wash them. A neat housekeeper will have the same dish-cloth in use until it is worn out, when it should be put in the rag-bag. Never allow the dish-cloth to be used for anything else but washing dishes.—*Mrs. W. T., in Agriculturist.*

Instruction in Cooking.

The New Bedford (Mass.), *Mercury* contains the following suggestive notice:—

"INSTRUCTION IN COOKING.—Ruth Russell is prepared to receive scholars for instruction in cooking. Special attention to be given to bread-making and pure yeast. Persons in service can receive instruction in one or all of the various branches of cooking on favorable terms."

Persons who have endured dyspepsia, with its varied agonies; long-suffering husbands, who have bought marketable provisions only to have them spoiled; diners-out, who have become martyrs in the pursuit of their noble profession; all who think that the function of eating ought to be cared for, and that good digestion should wait on appetite, will read the above advertisement with the belief that no lady could undertake a better business.

THE USE OF BUTTERMILK.—Persons who have not been in the habit of drinking buttermilk consider it disagreeable, because it is slightly acid. There is not much nourishment in buttermilk, but the presence of the lactic acid assists the digestion of any food taken with it. Buttermilk is an excellent substitute for fruit in winter, and is also very good in the spring toward keeping off that unpleasant complaint generally known as spring sickness. The Welsh peasants almost live upon oat-cake and buttermilk. Invalids suffering from indigestion will do well to drink buttermilk at meal times.

HOW TO EAT STRAWBERRIES.—This is so perfect a fruit, so exquisite in flavor, so excellent in quality that cooking, or manipulation of any kind, rather impairs than improves it. A little white sugar and cream is the only addition that can be made, and even this is a concession to our unnaturally sweetened and perverted palates, rather than to the necessities of the case. As for strawberry pie, dumplin, pudding and the whole range of dishes in which strawberries are cooked, they should be stricken out of every housekeeper's list with a single reservation in favor of "strawberry cake," in which, however, the strawberries are not cooked, and which is so great a favorite with all that we dare not say a word against it.

MILKING PAILS should always be washed with a cloth and wiped dry with the cloth wrung out of hot water. Lay them on the side to dry. If turned bottom up, the steam cannot escape, and they will get yellow and sour, which will taint the butter. If they get yellow, scour with clean water and sand.

TO KEEP BEDSTEDS FROM SQUEAKING.—Sprinkle fine sand or ashes in the joints and under the bearings of the slats.

Domestic Receipts.

PUFFS FOR TEA.—One quart of sweet milk; one quart of sifted wheat flour; four eggs well beaten; two tablespoonfuls of melted butter; two tablespoonfuls of sifted sugar; half a teaspoon of salt. Bake in brown-ware cups, from twenty-five minutes to half an hour, in a brisk oven.

CHEAP SPONGE CAKE.—Break two eggs in a teacup; beat slightly; fill up with thick, sweet cream; then add one cup of white sugar; one cup of flour; one teaspoonful of cream tartar; one-half a teaspoonful of soda. Flavor with lemon.

SUGAR JUMBLES.—Six cups of wheat flour sifted; two of sugar ditto; one of butter warmed; one of sour milk; one teaspoon of saleratus stirred into milk. Roll out with flour enough to make thin; cut a hole in the centre, and sift sugar all over the cakes. Bake on flat tins, from twenty minutes to half an hour.

GERMAN FLUMMERY.—Don't pass this by before trying it: Half a pint of milk, two ounces of Oswego flour, two ounces of sugar, boil together till moderately thickened, add a few drops of essence of vanilla or lemon, and mix with the whites of four eggs, beaten to a white snow; turn the whole into a wet jelly mold; set, to get firm, in a cool place, and serve with dip.

CHOCOLATE CREAM.—Chocolate, scraped fine, half an ounce; thick cream one pint; sugar, three ounces; heat it nearly to boiling; then remove from the fire, and mill it well. When cold, add the whites of four or five eggs; whisk rapidly, and take up the froth on a sieve; serve the cream in glasses, and pile up the froth on the top of them.

TO BLEACH BEESWAX.—The best way is to make it in thin sheets and passing a string through them, hang them in a window exposed to the light and sun; and when sufficiently whitened they can be melted and made into any form desired.

TO CLEANSE BLANKETS.—Put two large tablespoonfuls of borax and a pint bowl of soft soap into a tub of cold water. When dissolved, put in a pair of blankets and let them remain over night. Next day rub and drain them out, and rinse thoroughly in two waters and hang them to dry. Do not ring them.

RICE PUDDING.—Boil a quarter of a pound of rice in water till it is soft, then drain in a sieve, and pound in a mortar; and five well beaten yolks of eggs, a quarter of a pound of butter, the same quantity of sugar, a small nutmeg, and half the rind of a melon grated; work well together for twenty minutes, and add a pound of clean currants; mix well, and boil in a pudding cloth for an hour and a half. Serve with wine sauce.

POP OVERS.—Batter two cups of milk with two cups of flour, add the yolks of two eggs, a little salt, lastly the whites; bake in small tins.

Mechanical Hints.

SANDING PAINT WHITEWASH.—The simplest way of sanding is to dust it over the second coat of paint a sufficient quantity of which will adhere to the fresh paint to form a uniform surface. A thin third coat is sometimes applied over this to cause more firm adhesion, but it is not necessary on the rough cottage siding.

A cheap outside application is made of the best and purest lime wash, of the consistency of thick whitewash, to which, after the lime is fully dissolved and intermixed, one-twentieth of the lime is added in white vitriol (sulphate of zinc), which will cause the whole to adhere, and become more durable than lime alone. Its brilliant whiteness may be softened to a cream color, by adding a fifteenth of the lime in yellow ochre, or to a fawn color by the same quantity of a mixture of 8 quarts of number 8 of Indian red, and 1 of lampblack.

HARD CEMENT.—A cement which becomes excessively hard in time may be prepared by mixing 2 parts of silica, 1 part of silicate of alumina, and 9 or 10 parts of carbonate of lime, all in powder, and then roasting in a puddling furnace. The remaining mass is then to be ground and again roasted with 2 or three parts of carbonate of baryta. In practice, very pure sand will answer for the silica and chalk for the carbonate of lime, the remaining ingredients being supplied by mineral witherite or natural carbonate of baryta.

The following rules for the care of furniture are from an article in the *Technologist*: "Keep water away from every thing porous, alcohol from varnish, and acids from marble."

LIFE THOUGHTS.

A GOOD way to expand the chest—carry a big heart in it.

THE best way to patch up a quarrel is to split the difference.

HE who suppresses a moment's anger may prevent days of sorrow.

SAY little, and to the purpose, and you will pass for somebody.

WHOEVER is afraid of submitting any question, civil or religious, to the test of free discussion, is more in love with his own opinion than with truth.

LITTLE local noises deaden the loudest distant ones; so it is that this world shuts out the voice of Almighty God.

WE often omit the good we might do in consequence of thinking about that which is out of our power to do.

DEAL gently with those who stray. Draw back by love and persuasion. A kiss is worth a thousand kicks. A kind word is more valuable than a mine of gold.

MORALIZING.—It is one thing to moralize another thing to act. There are men who can utter the most refined and elevated sentiments and at the same time be guilty of crimes of the deepest dye. These are the most dangerous of mankind.

BELIEF.—The real test of belief is action. If a man tell us he believes a certain course to be right to adopt but in his own case acts as if he believed the contrary, we justly consider him destitute of the belief he professes.

Bright Sundays.

Let it rain every other day in the week, so that it be pleasant on Sunday. Then let the sky be blue, and the sea. Then let the birds sing, and the little children. Then let the green fields be full of blossoms, and let no ascetic say it is "wicked" to pluck them. Then let the sunlight into your houses, place flowers on your table, have an extra sweet morsel for little mouths, and a pleasant word to everybody. I had almost said do anything but make the day one of gloom. Do anything that a man or woman may do, and look the pure stars in the face, but don't groan; don't set back the chairs against the wall; don't bring out dry theological books, for young folks to read, written by library men, who never so much as peeped into the windows of a warm human heart. Don't fold your hands over your Sunday suit, and look the ceiling out of countenance. Don't bribe your children to read six chapters in the Bible; don't frown if they smile; don't let your young people long for the going down of the Sabbath sun, counting the tardy minutes, like a restless prisoner, waiting his release. Oh, anything but that; as you love truth above hypocrisy; as you love honor and obedience beyond secret license; as you dread the shadow of moral death on those bright young faces, which I am sure you love.—*Fanny Fern.*

A TENDER CONSCIENCE is like the apple of a man's eye; the least dust that gathers in it affects it. There is no surer and better way to know whether our consciences are dead and stupid than observe what impression small sins make upon us. If we are not very careful to avoid all appearance of evil, and to shun whatever looks like sin if we are not so much troubled at the vanity of our thoughts and word, at the rising up of sinful desires, as we have been formerly, we may then conclude that our hearts hardened, and our consciences stupefying for a tender conscience will no more allow of small sins than of great ones.

THE WILL OF PROVIDENCE.—There is sometimes a kind of blind submission to what is termed the will of Providence that savors strongly of indolence. The truth is, we can never know what that will is until our own duties in the matter, as far as we can discover them, are accomplished. Then, and only then, are we justified in awaiting the result in patient resignation, and then only will strength of will in endurance be as heroic as strength of will in action.

HYPOCRISY.—To be perfect in hypocrisy, it is not only necessary to assume a virtue though you have it not, but also to hide your real character. The latter is a rare accomplishment, and only those well versed in deceit of every kind are capable of it.

A CHRISTIAN should never plead spirituality for being a sloven. If he be a shoe cleaner, he should be the best in the parish.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third season. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier. You cannot take hold of it too confidently, and you can warrant your customers that it is Unequaled.

For Whiteness and Brilliance of Flame,
Economy in the use of Oil,
Freedom from Smoke or Smell,
Reliability in Wind and Motion,
Coolness of Burner and Oil Cup, and
Impossibility of Heating or Explosion,

For the Variety of Places and Purposes to which it is adapted, the readiness with which it Sells, and the
Complete Satisfaction it Gives
to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render All other Kerosene Lanterns so Disagreeable, Unreliable, Wasteful and Dangerous. Please favor us with your orders PROMPTLY, and oblige

CARLES R. DONNER'S PATENT

IMPROVEMENT IN

HUBS AND AXLES

This new patent is for an improved manner of uniting the steel spindle, I, with the iron portion of the axle, J, with the double collar, K, and also in the formation of a sort of hub on the holding-nut, F, which hub can be shortened so as to bring the nut closer, and thus compensate for any end wear of the box; also in the use of secondary steel boxes, a, a, within the main axle-box, B, and a series of oil-cups, C, d, arranged on the hub and an outer nut, which opens at various points within the box. A cap and protecting-ring are secured at the outer and inner ends of the hub, respectively, to protect from dirt.

An operative model and full description are necessary to show fully all the merits of the invention. The patentee can prove the value of the invention from actual working; that it is an easy mode of construction and furnishes a durable and more complete hub and axle than any other that has yet been devised. The attention of Manufacturers is solicited. All persons are cautioned not to infringe on the above patent under penalty of the law.

CARLES R. DONNER, Inventor and Patentee,

Kauri Gum.

Mr. J. W. Cartier, of Auckland, New Zealand, having determined to test personally and practically the reports concerning our State by a settlement here, has visited the office of the Press for the purpose of giving and receiving information concerning the two countries.

Mr. Cartier has given us a specimen of kauri gum, an article of considerable commercial importance, and one for which the demand is increasing. It is used in the manufacture of varnishes, in stiffening ready-made clothes, in making ornaments (by melting it and running into molds), and for various other purposes.

The Kauri tree (*Dammara Australis*), a member of the Pine family, grows in New Zealand, principally to the north of Auckland, very little of the timber or gum occurring to the south of that place. The tree grows generally to a diameter of about 6 feet, but 15 feet is not uncommon; its height, from ground to lowest branches, is often 100 feet. The largest tree known is at Mercury Bay, is called the "Father of the Kauri," and measures 72 feet in circumference near the ground.

The gum is found exuding from the trees, and in the ground around the roots. The most valuable sort, however, is found in places where no trees have grown within the memory of man. This occurs in lumps, varying from one ounce to twenty pounds, even as high as 70 pounds, at a depth of from 3 inches to 2 feet below the surface, just above the clay and under the sod. It is generally obtained from the poorest lands, where a stiff white or red clay occurs, and where ferns are generally abundant, but no trees; or in swampy ground.

Two years ago, the gum was worth \$250 per ton in Auckland; now it is sold for about \$125 at that place, or \$110 where found. A large number of men are engaged in digging for it. The common method of prospecting is to prod the ground with a pointed iron wire, fastened to a stick, until a lump is hit. Ground which has been considered worked out previously, has since proved rich in many instances.

It would appear that the use of the gum was increasing, and the trade in the article bids fair to assume important dimensions.

The New Erie Sleeping Coaches.

The conveniences of modern travel—how are they multiplying! Cars heated by hot water lighted with gas, cushions of velvet, walls covered with oil paintings, carpets of the finest Brussels, curtains of tapestry, beds of curled hair, ceilings in fresco, windows of French plate glass, mirrors of the finest quality, seats of carved walnut, walls of splendidly polished hard woods, cornices fit for the finest library, hooks and handles and bars of the finest silver. Such are the appointments of the new sleeping coaches built for the Erie Railway, and which are now running between Cincinnati and New York. They call them Drawing-Room Palace Sleeping Coaches, and they are worthy of the name. They have the comfort of a bed chamber, the beauties of a parlor, and the capacity of a drawing-room. The seats are really luxurious, covered with a species of velvet called French moquette, of the most beautiful colors, and with medallion patterns in the center of each seat. The wood work is all black walnut, with panels of the same material made from the most beautiful veneers cut from the knots of this wood. The work is oiled and polished so that it is as fine as the best furniture. Five fine globes from above, surrounded by rich appointments, furnish light by night. In the main room, after the beds are all put away and hidden from view, the traveler looks upon the walls decorated with twenty oil paintings. In this coach is a parlor or family room, six by nine feet, capable of accommodating six persons. There is nothing apparently that could be added to this to make it more attractive and comfortable. There is still another stateroom in the rear that will accommodate four persons. A wash room at either end furnishes every possible convenience in this line. The bed clothing is of the best, and the amplest arrangements have been made for clean linen.

The coach is warmed by Baker's patent hot water furnace, which is so constructed that, in the event of an accident, the fire will not be communicated to the surrounding wood. Fifty persons can be accommodated in each car.

The Erie and Atlantic Sleeping Coach Company have planted thirty-eight thousand dollars in this marvel of the car kind. Whether it will blossom into handsome returns would seem to admit of no doubt, when it is remembered that the charges on these are the same that are made in the common coaches.—*Indianapolis Journal*, Dec. 7th, 1870.

Notes on Contributions to our Cabinet

We are indebted to Mr. E. Durand, who has charge of the fine mineralogical collection of Mr. F. L. A. Pioche, for the specimens noted under Nos. 522 and 523.

No. 522.—Calcite, the variety commonly called "Suisun Marble." Two fine specimens are presented us, one showing excellently well the banded structure, with layers of calcite, of different colors, on the accompanying sandstone; the other giving a wider layer showing the crystalline structure. The specimens came from Fairfield station, on the line of the California Pacific Railroad, in Solano county, where they occur in the cretaceous sandstone of the Pelevo Hills. They are formed by deposit from calcareous springs. The pieces have different colors, from a white, yellow and red to a rich, dark yellowish or reddish brown, with banded structure. It is a very ornamental stone, and beautiful polished specimens are quite common. The stone would be much sought for if large pieces could be found, which has not been the case so far. The color probably originates from organic substances, as it disappears on burning. The stone is used for lime.

No. 523.—Porcellophite, from the Dry Dock, San Francisco. This is a species of serpentine, a silicate of magnesia with water, but with less iron and lime than the ordinary serpentine.

No. 524.—A specimen of silver ore from the King William mine, Battle Mountain District, Humboldt Co., Nevada. The rock contains throughout pieces of native silver, in which it is rich. The gangue is quartz ore with decomposed feldspar. The ledge is a new discovery, now being worked, which is owned by Messrs. Drake, Robb, Kelly and others, to whom, we presume, we are indebted for the specimen.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

CAL. ICE MANUFACTURING Co.—April 11. Capital Stock, \$250,000 in 500 shares. Trustees: J. A. Robertson, A. Austin, D. D. Colton, J. T. Dean, H. P. Wakelee, T. J. L. Smiley and F. McLennan.

CALEDONIA S. M. Co. Gold Hill, Nevada.—May 2. Capital Stock, \$2,000,000 in 20,000 shares. Trustees: W. B. Browne, A. Doble, T. Nelson, W. F. Halsey and M. White.

Wool Leather, 3 doz.	30 00 @ 50 00
Buff Leather, 3 foot	22 00 @ 25 00

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 21st 70 shows that our patron has paid his subscription up to the 21st of September, 1870; 4/72, that he has paid to the 4th of January, 1872; 4/10, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

W. H. MURRAY—Eastern States.
M. B. STARR—Pacific Coast.
THOS. POYZER—California.
Wm. J. CLARK—California.
L. P. McCAFFRY—California.
E. P. HICKS—California.
A. C. KNOX, City Soliciting and Collecting Agent.

London Agency.—BATES, HENDY & Co., 4 Old Jewry, E. C., & Geo. Street, 30 Cornhill, E. C. London will receive subscriptions and advertisements for the Press.

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in this week as possible.

FOUR MONTHS' SUBSCRIPTION FOR \$1.—Subscribers to the Press who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office. apl-bp-tf

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

PSYCHOMANCY.—Any Lady or Gentleman can make \$1,000 a month, secure their own happiness and independence by reading Psychomancy, Fascination or Soul Charm. 400 pages. Full instructions to use the power over men or animals at will, how to mesmerize, become Trance or Writing Mediums, Divination, Spiritualism, Alchemy, Philosophy, Omens, and Hears, Bright Young's Harem, Guide to Marriage, &c., 200,000 sold. Sent by mail in cloth for \$1.25 paper covers, \$1.00. The Philadelphia Star speaking of the book says its author is HERBERT HAMILTON, B. A., the celebrated Psychological lecturer, and publisher, T. W. EVANS, one of the oldest Publishers and Publishers in the city, the mention of whose name is a sufficient guarantee of the merits of the work. Mr. EVANS has spent \$30,000 already in the cause of getting out this extraordinary book. Skeptics in Psychology read and be convinced of this wonderful occult power.

NOTICE.—Any person willing to act as Agent will receive a sample copy FREE. As no capital is required, all desirous of genteel employment should send for the work, enclosing 10 cents for postage, to T. W. EVANS, 41 S. Eighth street, Philadelphia, Pa. ma4-lam3t

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to the finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the 'Maravilla' Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of which also may be had Taylor Brothers' Genuine Homoeopathic Cocoa and Soluble Chocolate Steam Mill—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. fe25-ly

7-30 GOLD LOAN

OF THE

Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun July last) is being pushed forward with great energy from both extremes of the line. Several thousand men are employed in Minnesota and on the Pacific coast. The grade is nearly completed 26 miles westward from Lake Superior; trains are running over 130 miles of finished road, and track-laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul & Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September next this will be increased to at least 580 miles.

A GOOD INVESTMENT. We are now selling, and unhesitatingly recommending, as a profitable and perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear Seven and Three-tenths per cent. gold interest (more than 8 percent. currency), and are secured by first and only mortgages on the ENTIRE ROAD AND ITS EQUIPMENTS, and also on

23,000 ACRES OF LAND to every mile of track, or 500 Acres for each \$1,000 Bond. They are exempt from U. S. Tax; Principal and Interest are payable in Gold; Denominations: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to their character as a first-class, prompt-paying Railroad and security, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.

SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed. The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their ample security and high rate of interest there is no investment accessible to this people, which is more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 6 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.

OTHER SECURITIES—AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXPRESS CHARGES on Money or Bonds received, and on Seven-Thirties sent in return, will be paid by the Financial Agents. AGENCIES for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application at any agency, or from the undersigned.

Phelps' Patent Animal Trap.

FOR GOPHERS, SQUIRRELS, RATS, CATYOTES, and other "Varmints."

This Trap, as may be seen, is of simple construction, not likely to get out of order, and very durable.

It is Very Efficient

and can be used conveniently by women or children THE CHEAPEST AND BEST YET INVENTED. Price 50 cents. By mail, prepaid (to places where express charges high), \$1. A liberal discount to clubs or dealers who buy by the dozen. Address the inventor and manufacturer,

D. V. PHELPS,

San Leandro, Alameda County, Ca

Travelers are always liable to sudden attacks of Dysentery and Cholera Morbus, and these occurring when absent from home, are very unpleasant. The PAIN KILLER may always be relied upon in such cases. As soon as you feel the symptoms, take one teaspoonful in a glass of new milk and molasses, and a glass of hot water, stir well together and drink hot. Repeat the dose every hour until relieved. If the pain be severe, bathe the bowels and back with the medicinal oil.

In cases of Asthma and Phthisis, take a teaspoonful in a glass of hot water sweetened well with molasses; also bathe the throat and stomach faithfully with the medicinal clear.

Dr. Sweet says it takes out the soreness in cases of bone-setting faster than anything he ever applied.

Fishermen, so often exposed to death by having their skin pierced with hooks, and fins of fish, can be relieved by bathing with the Pain Killer as soon as the accident occurs; in this way the anguish is soon abated; bath as often as once in five minutes, say three or four times, and you will seldom have any trouble.

The bites and scratches of dogs and cats are soon cured by bathing with the Pain Killer clear. may6-1m

YOUNG LADIES' SEMINARY, BENICIA.

The Twentieth Annual Session of this well known institution will commence on the

28th day of July Next.

Previous to that date there will be a complete renovation of the establishment. A fine School Room and many other improvements will be added, and new furniture, carpets, bedding and apparatus supplied.

The course of study and mode of instruction will be such as the best modern culture demands; and the every genuine advantage of school and home, the institution will prove its claim to a place in the first rank.

FOREIGN PATENTS

For Pacific States Inventors

ARE SECURED IN MUCH LESS TIME.

—BY—

DEWEY & CO.,

Proprietors of the

SCIENTIFIC PRESS,

Than through any other Agency.

ESTABLISHED IN 1860,

This Firm can be Relied Upon

—AS—

HONEST, COMPETENT, PERMANENT.

All of which points are imperatively requisite in Attorneys, for the Interests of their Applicants for Patents in distant lands.

Our Associates and Correspondents are the Best Practitioners in every country where Patents are granted.

For Foreign Patents no model is required except in Canada. The Specifications and Drawings of the American Patent, if complete and perfect, will suffice for us to prepare the case. In Great Britain and other countries we apply for patents in the inventors' own names, thus avoiding their being published to the world in the name of a foreign agent, as is usual through other and less painstaking agencies.

Frequently several inventions, covered by different patents in the United States, of the same subject, can be skillfully combined in one patent in foreign countries, when well understood by intelligent attorneys.

As the privileges of our inventors are cut off in some countries, and curtailed in others, if not applied for soon after the issue of the U. S. patent, we advise inventors whose patents will be valuable in various populous civilized countries, to lose no time in applying for patents whenever they intend to obtain them for themselves or the benefit of others—with their own means or through the resources of those who are permitted to share the benefits. It must be remembered that the English (and some other important nations) invite the early introduction of inventions into their realms, by offering patents to the first introducer (which means the first applicant), without regard to the rights of the actual inventor, who has no after recourse.

For important inventions it is best to apply for foreign patents at the time of application for or before the issue of the U. S. patent.

Term of Patents in Foreign Countries.

Countries.	Period of years granted, etc.
AUSTRALIAN COLONIES:	
VICTORIA.....	14 yrs. in successive periods, 3, 4 and 7 years.
TASMANIA.....	14 yrs. in successive periods, 3, 4 and 7 years.
NEW SOUTH WALES.....	7 to 14 years.
QUEENSLAND.....	7 to 14 years.
NEW ZEALAND.....	Full term, 14 years.

PONTUOAL.....	Importation 5, Invention 10 years.
PRUSSIA.....	Usually 5 years.
PERU.....	25 years or more, determined by government.
RUSSIA.....	5 to 15 years.
ROMAN STATES.....	Importation 1 to 6 years, Invention 3, 5, 10 years.
SAXONY.....	5 years, with prolongation to 10.
SPAIN.....	Importation 5 years, Invention 5, 10 and 15 years.
SWEDEN.....	3 to 5 years, at the option of government.
WURTEMBERG.....	5 to 10 years.

THE PRICES for foreign patents range in some countries according to the term for which they are taken. We will furnish the prices for any particular countries on application to us.

We have the Foreign Patent Laws, Foreign Patent Reports, and other valuable and assisting documents, for ready reference in our Scientific Press Patent Agency Library—the most complete Patent Library on this side of the Continent.

Any further information regarding the time within which patents must be worked in any foreign country, time of payment and amount of annuities for patents in any of the above countries, will be cheerfully given on application.

Full particulars regarding any countries not named above, will also be given when desired.

THE OFFICE OF

"THE BUREAU OF MINES"

AND

Mining Statistics of the Pacific Coast"

IS LOCATED FOR THE PRESENT AT

No 729 Montgomery Street, Room No. 3.

OFFICE HOURS—From 11 A. M. until 3 P. M. for the Registry of Mines.

Parties desiring to communicate by letter, will obtain

Prompt and Reliable Information

Respecting Mines and Mining Property, by addressing

E. P. HUTCHINS,

Secretary of "Mining Bureau Pacific Coast,"

San Francisco, Cal.

Care of Lock Box 406.

22v-18-4f

TO THE MINING INTEREST.—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanics' Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL TO OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 6th, addressed to Mechanics' Institute, care J. H. Gilmore, San Francisco.

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, THAT BETTS'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

MANUFACTURERS—1, WHARF ROAD, CITY ROAD,

LONDON, AND BORDEAUX, FRANCE.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Hanscom Copper Mining Company.—Location, Low Divide District, Dol Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 23rd day of April, 1871, an assessment of five (5) cents per share was levied upon the capital stock of said Company, payable on and after the 6th day of May, at this Secretary's office, 21 and 23 First Street, Office Golden State Iron Works, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the 12th day of June, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 26th day of June, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,

JAMES S. BIDDOLPH, Secretary.

Office Golden State Iron Works No. 21 and 23 First St.

San Francisco, 18v22

Salamander Gold and Silver Mining Company, Leon's Ranch, Mill Valley District, Calaveras County, Cal.

Notice is hereby given, that at a meeting of the Trustees of said Company, held on the 4th day of May, 1871, an assessment (No. 3) of thirty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 12th day of June, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 19th day of July, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

E. J. PFEIFFER, Secretary.

Office, No. 210 Post street, San Francisco. 18v22-4v

Sierra Iron Company.—Location of Works, Sierra and Plumas Counties, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 17th day of May, 1871, an assessment of Sixty (60) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold or silver coin, to the Secretary, at the office of the Company, No. 428 California street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the 25th day of June, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the 20th day of July, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee
that the purchasers shall be under no expense for re-
pairs for TWELVE MONTHS, and guarantee the mill to
crush (regular work) One Ton Per Hour of the Hardest
Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.
To put one of the Wilson Mills over the mountains,
from \$10,000 to \$18,000 is saved in First Cost.The Wilson Mill will save in working expenses and
repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its
merits. One can always be seen at the Pacific Iron
Works.Ten of these Mills are now in operation.
For further particulars address

FURMAN R. WILSON,

San Francisco.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW
CUP." This is
a California
Invention,
and the
BEST and
Most Eco-
nomical
Lubricator
in use. It
keeps cool,
and its op-
erations are
very readily
observed.
Send for
Circular to
W. T. GAR-
RATT, Cor.
Mission &
Fremont
streets, San
Francisco.DESCRIPTION.—D, is a glass chamber which contains
the lubricant. C is a valve, connecting with cup which in-
troduces the lubricant into chamber D. F, is the discharge
pipe for the lubricant, provided with an inverted syphon to
prevent steam from coming back from the steam chest or
steam cylinder into the instrument. E, a waste pipe and
valve for drawing waste water from the oil chamber before
re-charging the same. B, a valve and pipe to introduce
water under the lubricant for the purpose of expelling the
same; this pipe is connected to the boiler or steam pipe
therefrom. A, is a steam condensing pipe or vessel, to pro-
vide a full supply of clean and pure water for the election
of the lubricant from the oil chamber; the rapidity of action
being regulated by the valves B and C. 1618-tf

STEAM JET PUMP.

Blaklee & Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER PUMP for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke or start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.
Send for Circular. PARKER & HUNT, Southeast cor. Tenth & K Streets, Sacramento City Cal. AGENTS—CHAS. F. BROCK, 117 California St., San Francisco; KEPP & BADOIN, Stockton. 57 Cau. be seen at McAFEE, SPIES & Co's. Boiler Works, S. F. 21v21-tf

TRAVIS & WAGNER!

AGENTS FOR

Dufour & Co's.,

Celebrated Dutch Anchor brand Bolted Cloths; Smut Machines; Bran Dusters; Mill Picks; Mill Picks dressed; Mill stones repaired rebuilt and balanced.

MANUFACTURERS OF French Burr Mill Stones, Portable Mills of all sizes,

from 16 to 36 inches, for grinding Corn, Barley, Feed, Salt, Pulses, Drugs, &c. Mills specially adapted for grinding Quartz. 2v21-lyna 41 First st., San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and sellers for themselves, at the office, 220 Fremont Street, San Francisco.

Gold Saving Amalgamated Plates.

Miners, Quartz Millmen—Attention.

Best quality of Silver Plated Amalgamated Plates for saving fine particles of gold, furnished at the

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,**MINING,****And BLASTING****POWDER,**

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others. We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 18v20-3m JOHN F. LOHSE, Secretary.

THE AMERICAN SUBMERGED PUMP.

Has no leather packing, is composed entirely of metal, rendering it less liable to get out of repair than the ordinary packed pumps. It is admirably adapted for Irrigating purposes and for Watering stock.

As a Safeguard against Fire it has no Equal,

One of the medium size being capable of protecting an ordinary frame dwelling. In short it is an article that

PATENT BROKERS.—Inventors having valuable patents and needing reliable assistance in selling them should consult WEISTER & Co., No. 17, New Montgomery street, under the Grand Hotel, San Francisco.

EXCELSIOR IMPROVED DOUBLE-ACTING SUCTION AND FORCE PUMP.

HOOKER'S PATENT, August 13, 1865, and January 15, 1867.

VALVE.

We call the especial attention of all Millwrights, Miners and Farmers to this very superior Force Pump. It is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and warranted to furnish more water than any other pumps of equal caliber. It has Poppet Valves, which can not be wrongly placed in the Pump. The Fair of the Mechanics' Institute, held in the city of San Francisco, awarded the owners of this Pump, for its SUPERIORITY, A FIRST PREMIUM AND SILVER MEDAL. Suitable for DEEP WELLS, Factories, Mining, Breweries, Sugar Refineries, Tanneries, Railroad Purposes, Drainage, Irrigation, etc. As the above Pumps are already in use in the principal Sugar Refineries, Factories, Rolling Mills and Gardens in this city, reference may be had where they are working. See circular for particulars.

General Agents.—MESSRS. DRITMAN, HOLBROOK & CO., 111 and 113 California street, and 17 and 19 Davis street, are Agents for the sale of the Excelsior Pump, who make liberal discount to the trade. H. J. BOOTH & CO., Union Iron Works, First Street, corner of Mission, San Francisco, who manufacture and have the sale of the Excelsior Pump.

V. CUSHING, Proprietor, San Francisco.

We have BRASS-LINED, BRASS PISTON and BRASS VALVE PUMPS, at greatly reduced prices. Also STEAM PUMPS.

VOLUME XXI
Number 21.

Sash Tightener.

This device is for the purpose of preventing the very disagreeable rattling of windows in their casings, is very simple in its construction, and its object is of really very considerable importance. It may be said that it ought not to be needed, that the windows ought to be so constructed as to fit nicely in the casings, so that no rattling is possible. This is very true; but as the construction is not so nice as this in very many cases, and as, where originally properly arranged, a shrinkage of the wood, or other cause, leaves too often a space between sash and casing, the fact remains that a sash tightener is very frequently a desideratum.

The accompanying illustration shows the device applied to a sash. It consists of a metal plate, *A*, fastened to the sash by two screws on the inner side. The outer edge of the plate extends into the grooves

of the casing, and is made to press against the casing by means of a short spiral spring which, placed under the plate, surrounds the screw, *B*. By means of this screw, *B*, the pressure of the plate against the casing may be regulated if found desirable.

The device can be manufactured at small cost and easily attached to any window. It is the invention of Mr. William Swett, of San Francisco, who has taken steps to secure his right through the SCIENTIFIC PRESS Patent Agency. The sash tightener may be seen at the hardware store of H. Rosekrans & Co., 135 Montgomery street, S. F.

THE PACIFIC STONE COMPANY, of this city, have published a pamphlet giving full information in regard to the Ransome Stone, and the best of testimonials with regard to their manufacture.

STEAMBOAT SPRINGS.—The *Territorial Enterprise*, of May 16th, says that the story that the Steamboat Springs had dried up, was a canard. They are running in as good order as ever; in fact, rather better.

THE news of the outrageous proceedings at Paris of the Commune is such as to shock the whole civilized world. The action of the fiends loses them all sympathy from all parties.

Baking by Machinery.

The introduction of machinery for preparing and baking bread on our coast, is an event of no little interest and importance. We believe that several unsuccessful attempts have been made previously, but it has been reserved for the enterprise and skill of the proprietors of the California and Boston Cracker Works to successfully inaugurate this important addition to our home manufactures.

The bakery is at No. 803, Battery street,

during the circuit. A shelf being loaded, the touch of a lever causes a partial revolution of the arms, carrying the loaded shelf into the hotter regions of the apparatus, and bringing down to the opening of the oven another full of delicately baked crackers, which are raked out into a basket, the shelf being again charged with a fresh lot.

Underneath the oven is the furnace so arranged that the smoke is all consumed, and the temperature is kept under perfect control. This is regulated so that the

MECHANICAL REEL OVEN OF THE CALIFORNIA AND BOSTON CRACKER COMPANY.

near Broadway. At the entrance, one's attention is attracted by the lofty piles of flour sacks and by a most agreeable and appetizing odor. As we pass into the large room on the ground floor, we see hoppers, and mixers and rollers, all driven by machinery, and arranged so as to save manual labor. The various raw materials are put into a hopper and thence pass into the

crackers are "done to a turn" in one revolution,—neither too much nor too little.

The yield of the oven is carried upstairs to the packing room, where are barrels and boxes of excellent food. For transportation of material from one story to another, there is used an elevator, constructed by Messrs. Hobbs and Gilmore, the simplicity of which forms a strong recommendation

MELENDY'S COMBINED KEY RING AND DOOR FASTENER WITH COMPENSATOR.

proper apparatus for thoroughly incorporating the ingredients.

A final roller rolls the dough, when properly prepared, into thin sheets. At the time of our visit crackers were being packed. The sheet of dough slid down an inclined plane and under a peculiar cutter which divided it into pieces of proper size and punched the holes which are requisite to prevent distention in baking. An apron then carried the sheets to the man who charges the oven.

In this oven, a representation of which is here given, are ten shelves, 10 x 3½ feet, suspended on revolving arms in such a way as to retain their horizontal position

for it and for San Francisco manufactures.

In the factory, the use of machinery tends to cleanliness and to diminish the traditional peck of dirt which we are supposed to receive into our stomachs during each moon. Order reigns everywhere, and neatness prevails. Yet in the course of every ten hours, fifty barrels of flour are transformed into the various forms of crackers, cakes and biscuits, and sent off to hungry mortals. Of the excellent quality of the manufacture, we satisfied ourselves during our visit by personal tests.

The proprietors of the bakery are Messrs. F. Clay and H. T. Fairbanks, who have

spent a large amount of money in establishing their factory, and who have evidently used their money to the best advantage.

Melendy's Combined Key Ring and Door Fastener with Compensator.

This is a neat little device, which is exceedingly simple in its parts, yet on which three patents have been secured as improvements have been successively made in its construction. It is intended as a secure fastener of doors, and as such is said to be very popular, while, being exceedingly light and small, it can be carried in the pocket during the day, and used as a key ring.

Fig. 1 shows the device closed, as carried in the pocket. The compensator, *A*, is carried on the chain as shown, and on this chain are also carried the keys.

Fig. 2 shows the device ready for use as a door fastener, and Fig. 3 shows it after the door is fastened. When needed for this purpose, the claw-hook, *C*, is opened and placed between the edge of the door and the casing, with the jaw towards the casing. By closing the door, the jaw is driven into the casing, as denoted in Fig. 3, where *E* is the door and *D* the casing. The body of the apparatus is then slid along to the position shown in Fig. 3, and the door cannot be opened by any one outside, unless the wood of the casing is torn out.

In the figures (2 and 3), the compensator, *A*, is shown turned up to the back of the hook. This is used in case the door should have shrunk so that it does not press sufficiently against the hook, *C*, to force it into the wood. As shrunken doors are not uncommon to the traveler, the compensator is a valuable addition to the device. In Fig. 2 the chain, *B*, is shown unlocked, to put on keys.

The device is exceedingly simple and easily manufactured, so that it can be furnished at a low price. It is the invention of Mr. B. H. Melendy, of Melendy Brothers & Co., Manchester, N. H., who may be addressed for further information.

DR. J. LAWRENCE SMITH, of Louisville, Ky., one of the best mineralogists of the United States, the inventor of the very convenient and useful chemical or inverted microscope, and of high standing as a chemist, whose name is of frequent occurrence in the best scientific publications of the Union, has just returned home after a tour of several weeks among various places of interest in this State. The doctor has been of late engaged in examining chemically a number of California minerals, a collection of which had been sent him by Mr. H. G. Hanks, of this city, and has, we believe, discovered a new mineral. A description of this will undoubtedly be published soon.

LORD WALSHINGHAM, of England, is making an extended tour through California, Oregon and Washington Territory, studying the entomology of the coast.

MECHANICAL PROGRESS.

AMERICAN MANUFACTURE OF SMALL ARMS.—The following is from the *New York Tribune* of May 5th:—"The aggregate of service rifles manufactured and shipped to France by the Remington Company since the 21st of September, reaches the extraordinary total of 154,120. Adding to this 19,777 carbines and 40,350 army revolvers, the number of their own arms furnished to Franco by the Remingtons is 214,247, figures which seem to justify the assertion of the *London Times*, in an article deploring the petty organization and inadequate resources of the British small arms manufacture, that one American establishment possessed a larger capacity for production than those of all England combined. The recent adoption of the Martini-Henry breech-loader as the British Service Arm, has elicited the fact that, with her present capabilities of manufacture, England can turn out the 300,000 stand, which is accounted the proper complement for her regular army in four years. No circumstance could illustrate better than this the relative superiority of the small arms industry of the United States. The Remington establishment at Ilion is by no means the only one in our country possessed of a productive capacity unknown to the British industry. Hardly less extensive than the Remington, in scope of operation, is the great Hartford Company, founded by Col. Sam. Colt. In the superb armory of this company, a structure actually unique in the perfection of its adaptedness, are fabricated not merely the Berdan breech-loading rifle and the well known revolving pistol, but whatever style of small ordnance may be required, from a Gatling battery down to a Derringer. The Providence Tool Company, the Brown Manufacturing Company of Newburyport, severally producers of the Peabody and the Van Choate breech-loading rifles; the two Sharps establishments of Philadelphia and Hartford, the Smith & Wesson of Springfield, which is now executing an order of 25,000 army revolvers for Russia, and the Winchester of New Haven, manufacturing the eighteen-shot repeating rifle, are all organizations unequaled by any in England. But the Remington, whose facilities—crowding four acres of brick and mortar, employing from 1,300 to 1,400 workmen—many of them a second generation of skilled artisans—paying out monthly \$138,000 for labor, consuming annually from 6,000 to 10,000 tons of coal, contributing to the thrift and absorbing the products of a large rural district—have been in seven months adequate to the completion of more than 170,000 stand of rifles, assuredly hold the first rank, not only in the United States, but in the world."

IMPROVED TURBINE WHEEL.—A recent patent is upon "making the buckets separate and movable, so that they may be polished for the purpose of lessening friction, or removed without taking the wheel apart; and providing a flange or bead upon each bucket, made in sections or continuous the whole length of the edge of the bucket, the flange fitting into a corresponding groove in the disks of the wheel, and secured by a screw bolt passing through the disks into the flange or the edge of the bucket. The upper portion of the mouth of the scroll is made so that it can be removed, which gives ready access to the gate, permitting the latter to be removed or adjusted without disconnecting the wheel from the flume. The gate is also provided with adjustable strips or bars placed on the inside by which compensation for wear is secured and leakage prevented."—*Sci. Am.*

LIGHT TELEGRAPH CABLES.—Capt. W. Rowett recently read a paper before the British Association in which he advocates the adoption of much lighter cables than those now in use. The cable of '57 weighed one pound per fathom. Capt. Rowett thinks one ounce heavy enough. Such a cable, he says, would sink at the speed of two miles per hour, and could be run out even in tempestuous weather, and kept under as perfect control as a log line, without the cumbersome and complicated machinery now used to pay out heavy cables. The author regards hemp as the proper material for covering the electric core. The material can, he says, be soaked with a preserving solution which will make it practically indestructible, and which in contact with water becomes very hard. He thinks that by the adoption of light cables, messages could be profitably sent for one-sixth of the present price.

OVER-TESTING OF IRON WORK.—We quote the following from the *Mechanics' Magazine*:—"A moderate proof-load is quite sufficient to demonstrate whether the example in question is capable of performing the ordinary duty that will devolve upon it, while a very severe one cannot do more, and at the same time may permanently damage the structure. The over-testing of any piece of mechanism or example of construction may be not inaptly compared to the over-training of a young athlete. When the powers are over-taxed, they are inadequate to perform their work when the time arrives. * * * Independently of the reasons that we shall refer to which indicate that excessive proof tests should not be used, there is the undeniable fact that iron structures do subsequently yield under a much less strain than that which they bore apparently with ease at the time of testing. * * * The effect of over-straining, particularly if it be accompanied by shocks and sudden violent wrenchings, is to render iron that is otherwise of a soft ductile nature, exceedingly hard and brittle. In fact, there is very little doubt that incessant repetitions of impactive forces tend in the course of time to completely alter the molecular constitution of the material, and, in a word, to convert wrought iron into cast."

UTILIZING GAS WITH A VENEOANCE.—The *New Orleans Republican* for April 9th has the following: "Yesterday morning, Mr. J. B. Knight, agent of the Watertown Steam Engine Company, sunk a drove well in the rear of his office, with a view to getting a supply of water; and when at the depth of forty-six feet, a sudden and very powerful draft of gas was observed to flow from the mouth of the pipe. He immediately closed the pipe, thinking to utilize this gas for illuminating purposes, but found the pressure too great; when the idea struck him to direct it into the boiler of one of his engines and experiment with it in making steam. But no sooner had the connection been made than the engine began to run entirely by the pressure of the gas acting upon the piston, at a pressure of twelve pounds to the square inch; and so it continued all day yesterday, giving no sign of exhaustion." The *Times* of same date notes the same, and adds: "When we witnessed it in operation, the gage marked a pressure of twelve pounds to the square inch, and the gas from the discharge pipe was burning brilliantly."

COATING STEEL WITH MOLTEN IRON.—A patent has been recently taken out for the following process:—"The plate or other article of wrought iron or steel to be coated is covered with powdered borax and raised to a welding heat. It is then placed upon a level iron table, and surrounded with a frame to prevent the flowing off of the metal to be poured upon it. We quote a paragraph from the specification:—"The molten iron which has been mixed with borax, is then poured upon the surface of the heated plate or other article of wrought iron or steel. When a sufficient quantity of molten iron has been poured on as described, a plate of steel or hard smooth iron, of sufficient size to nearly cover the whole of the molten iron, is brought down upon its upper surface, and a pressure immediately applied sufficient to reduce the molten iron to the desired thickness, and also to expel all the air or gases that may be contained in the molten iron, and which would otherwise render the coating porous and of no practical value."

PLANING VALVE-SEATS.—A correspondent of the *American Railway Times* says: "Portable planers are now constructed for the purpose of planing valve-seats, etc., and such jobs as cannot well be placed upon the table of a planer. These portable machines may be clamped to the article to be planed in almost every position possible, either horizontal, vertical, slanting, or bottom upward, and worked either by hand or power; but they must be in the hands of first-class mechanics, in every sense, like all other complex and truly useful machines, in order to do a good job."

SNAKE-SKIN BOOTS.—Fifty skins of the anaconda have, it is said, been tanned by Schayer Brothers, at the Boston Highlands, for boot leather. The tanning process was similar to that observed in the manufacture of alligator leather.

BASE BALL IMPLEMENTS.—One New York manufacturer alone made last year 162,000 balls. Mills are running all the year round, turning out nothing but bats. The *Times* says "the supply is barely equal to the demand."

SCIENTIFIC PROGRESS.

CRYSTALS IN PLANTS.—Dr. E. M. Hale has an article in the *Journal of Microscopy* upon the value of the microscope to the pharmacist. We extract the following: "It has been proven by microscopic examinations that saline substances are spontaneously crystallized within the cells of plants, the crystals having been found existing in infinite numbers throughout the bark, wood and leaves of a great variety of trees and shrubs. Prof. Bailey, of West Point, first called attention to this subject. He observed the crystals in the ashes of the hickory; afterwards he examined the bark previous to its being subjected to the action of fire. When the bark is illuminated by the rays of the sun, numerous glittering particles are seen. An examination proves them to be crystals, for when thin layers of bark or sections of wood are viewed by a microscope, the crystals are detected imbedded in their natural position. They are, however, better seen by scraping the bark upon a plate of glass, upon moistening which with the breath the crystals are made to adhere to the surface, while the woody particles are readily blown off. These crystals are identical in every particular with the polygonal bodies found in the ashes of hickory wood. Prof. Bailey examined the wood and bark of nearly every indigenous and foreign tree, and with the same result. Even in the densest woods, such as mahogany and lignum vitae, the crystals may be found by scraping the wood into a watch-glass filled with water, picking out the woody particles and then examining the residue. The crystals are likewise detached in the minute particles that fall from worm-eaten wood, sawdust, and in the finer particles of ground dye-woods. This shows that even the finely ground medicinal barks, woods, etc., used by the pharmacist, may be examined successfully for the crystals peculiar to them. It only remains to examine all the medicinal vegetable substances, and ascertain the peculiar crystals belonging to each. Then, if these are delineated and appended to our works on Medical Botany, and Pharmacology, a great and practical advance in our knowledge of the purity of drugs would result."

THE ELECTRO-TONIC STATE.—The following is a brief abstract from *Nature*, of an article in *Silliman's Journal* by Dr. A. M. Mayer, on "the physical condition of a closed circuit contiguous to a permanent and constant voltaic current; or, on the electro-tonic state." The author commences by giving extracts from Faraday's investigations, in which he uses the term electro-tonic state to indicate the condition of a wire in which an electric wave has been induced by the proximity of a conductor through which a constant current was passing. He has endeavored to obtain some clue to the condition of such a closed circuit by passing through it another electric wave of a constant intensity, and which he ingeniously generated by slipping a flat spiral from the end of a permanent magnet, as described in the number of this journal for November last. Currents thus obtained are found, by means of a delicate reflecting galvanometer, to be practically of the same intensity; for on repeating the experiment several times this produced deflections differing from one another to an extent not greater than 20". In this manner it was determined that a definite electric current, traversing a metallic circuit in proximity to another traversed by a powerful voltaic current, has the same intensity, whether passed in the same direction as the latter or in a direction opposed to it. The author thinks, however, that a diminution in the velocity of the current ensues, and he intends to continue his experiments in order to settle this question.

ANTHROPOLOGICAL INSTITUTE OF NEW YORK.—This is the new name of the old American Ethnological Society. Some fifteen gentlemen connected with the Society recently gathered at the residence of Hon. E. G. Squier, made this change of title, and adopted new by-laws. Mr. Squier, in introducing the subject of the meeting, said that "in the similar organizations of London and Paris the functions of Ethnology had been long since exchanged for the broader ground of Anthropology, so as to embrace under that general title the co-operative labors of the anatomist, the philologist and archaeologist, and combine in one scheme of study whatever relates to historic man."

HALLIEN'S PARASITICAL INVESTIGATIONS. The *Philadelphia Medical Times*, in noticing a critique upon the above by Dr. Weise alludes also to the researches of Dr. Billings (U. S. A.), and says:—"Dr. Weise is even more explicit in his statements than our Washington authority, declaring that he has found Prof. Hallien's work to be 'one mass of errors.' Dr. W. worked at the bedside day after day, studying all the secretions, the blood, the lymph of pustules, etc., and receiving from all the same answer, that they contained no cryptogamic growth. Nor was this from want of a sufficiently high power; for he used a No. 10 Hartnack's immersion lens. * * * 'In this connection, it is desirable to put upon record the results obtained at the Surgeon General's Office, Washington, in repeating the experiments of Dr. Jos. G. Richardson in which he claims to have demonstrated the passage of bacteria and vibrios from the stomach into the blood. It will be remembered that this method was examination of the blood before and after ingestion of putrid beef-juice. These experiments were repeated in precisely his manner, under the supervision of Dr. Woodward, so often and so carefully, and gave so uniformly negative results, that there can be but little doubt that there was some fallacy in those of Dr. R., and that vibrios do not appear in the blood after the ingestion of matters loaded with them."

RIGHT-HANDEDNESS THE RESULT OF NATURAL SELECTION.—Dr. Pye-Smith, according to the *Lancet*,—disposing of the theories that left-handedness is to be accounted for by transposition of the viscera, as asserted by Von Baer and others, or by an abnormal origin of the primary branches of the aorta, proceeds to argue that right-handedness arose from modes of fighting adopted. "If a hundred of our fighting ambidextrous ancestors made the step in civilization of inventing a shield, we may suppose that half would carry it on the right arm, and fight with the left; the other half on the left, and fight with the right. The latter would certainly, in the long run, escape mortal wounds better than the former (the heart being protected), and thus a race of men who fought with the right hand would gradually be developed by a process of natural selection." Of course the habit once acquired, of using the right hand more than the left, would be hereditarily transmitted from parent to child.

COLOSSAL SEA-WEED.—From the microscopic examination of the structure of specimens of the fossil trunks described under the name of *Prototaxites Loganii*, and which Principal Dawson affirmed in his Bakerian lecture before the Royal Society, to be the oldest known instance of Coniferous wood, Mr. Carruthers has discovered that they are really the stems of huge Algae, belonging to more than one genus. They are gigantic when contrasted with the ordinary Algae of our existing seas, nevertheless some approach to them is made in the huge tree-like *Lessonia* which Dr. Hooker found in the Antarctic seas, and which have stems about twenty feet high, and a diameter so great that they have been collected by mariners in those regions for fuel, under the belief that they were drift-wood. They are as thick as a man's thigh. —*The Academy.*

EXCEPTIONS PROVE THE RULE.—"It is the male birds who take the active part in pairing, and who not only fight for the possession of their mates, but display their colors, their voice, or whatever be their peculiar attractions, in order to gain the same end. This rule is confirmed by the exceptional case of the cassowary and a few other species in which the hens court the male birds, fight together in rivalry, and accordingly assume the brighter colors and more attractive shape usually worn by the male. Not only the parental and incubating instincts, but the usual moral qualities of the two sexes are in these cases reversed: 'the females being savage, quarrelsome, and noisy, the males gentle and good.'—*Darwin.*

INFLUENCE OF HEAT ON THE REFRACTION OF LIGHT.—At a late meeting of the Imperial Academy of Sciences, in Vienna, Prof. Stefan presented a memoir on the influence of heat on the refraction of light in solid bodies, containing a series of determinations of the refraction of rock-salt, sylvine (perchloride of potassium), alum, fluor-spar, and glass, at temperatures of 53°-6-201°-2 F. The refractive power of the first four bodies decreases uniformly, and for all parts of the spectrum, with the increase of temperature; the refractive power of glass increases with the temperature, and the increase becomes greater in passing from the red to the violet end of the spectrum.

CORRESPONDENCE.

The Tea and Coffee Plant in California.

EDITORS PRESS:—It may not be uninteresting to many of your readers to state that both tea and coffee are indigenous plants in California. The tea plant or hush grows in Sierra and Plumas in abundance, wild, from which the Chinese manufacture excellent tea, better than the imported. [?] This fact I have been cognizant of since 1854-55, and have partaken of it often. It is a hush about four or five feet high, having serrated, olive-shaped leaves, and delights to grow on mountain sides not far from some mountain stream, and is a hardy evergreen.

Coffee grows every where below the granite formation on a slate soil. It is distinguished by its lanceolated leaves, and peculiar herry, first bright red, then purplish-black. It is much sought after for browse, especially by sheep and goats, and has the same anti-sporific quality as its kindred of Tartary. The sheep who partake of it are extremely vigilant, especially the males. The berry is smaller and rounder than either Mocha, Rio, or Java coffee, and is vulgarly said to be (I don't know upon what grounds) poisonous to human beings. The hull, when ripe, has a sickening sweetish taste, but as I was afraid to swallow it I have invariably spat it out. If this is of any interest to you, you are welcome to publish the information, and perhaps some of your readers may be induced to experiment upon it. It never grows upon soil having granite for a foundation or bed-rock.

THOS. R. STODDARD.

The so-called "Coffee Plant," to which our correspondent refers, is the *Frangula Californica*, formerly known as a *Rhamnus*, of the Buck Thorn family. The berry is not poisonous as generally supposed. The plant grows in this city, on the hills back of the Mission. The true coffee of commerce belongs to the natural family *Rubiaceae*, and is a very different plant from the one alluded to by our correspondent. The coffee tree of Arabia is an erect, conical-shaped, low tree, with a light brown bark, and opposite, oblong, wavy, shining light-green leaves. The berries are first green, then red, and black when ripe. The beverage prepared from these berries is said to have been used in Ethiopia from time immemorial, and to have been introduced into Arabia from Persia in the 15th century, and in Europe soon afterwards.

The real tea plant (*Camellia*) does not grow native in this State; but the Chinese use the leaves of several plants as substitutes. To which of these our correspondent refers, we cannot tell without seeing a specimen.

Krupp's Steel Works.

[Written for the Press.]

The following concerning Krupp's enormous works at Essen, Prussia, is translated from a private letter written (in German) by a gentleman who obtained admission into the works. A number of years have elapsed since the letter was written, but as we are unaware of the previous publication of anything of the kind, we give it as a thing which will be interesting and new to many.

How Steel is Made.

The steel, which is melted in crucibles, is, as far as I know, but puddled steel, and is made from white iron, called spiegeleisen, and gray iron, equal parts. Gray cast iron is used for the purpose of easier melting and working. In each puddling furnace, 400 pounds of steel are made within the space of two hours. In order to get the melting iron covered, some iron slag, from the last puddling process, is added to it.

At the beginning of the process, the iron pieces are placed in the puddling furnace in an erect position, the flame being conducted over them very slowly, a chimney of 200 feet supplying the necessary draft. In the chimney itself is placed an upright boiler for making all the produced heat as useful as possible. A boiler in the before mentioned position does not deposit so much sediment as in any other position, lasts longer, and is safer.

As soon as the iron has become liquid, it is stirred up with a hook-like iron bar, reaching to the bottom of the furnace, without interruption. The iron being thus perfectly and thoroughly liquified, a kind of flux of sand and salt is

added, by spreading it over the surface and stirring it into the melted iron. Thus all or nearly all of the impurities are brought to the surface.

During this, the reddish blaze changes by degrees to white, and this is exactly the time when the iron becomes converted into steel, and therefore must be known and well observed by the puddler, who has to shut off the draft now and stir up the liquid mass, the steel becoming thus coherent or clotted. Should the puddler neglect this important moment, the steel becomes wrought iron. The puddler then divides the thus prepared liquid mass into four nearly equal parts of porous and spongy aspect. Every piece of steel thus prepared, is taken by means of peculiarly adapted tongs, placed on an iron basket wagon, and carried off to the steam hammer, where, by a sudden push of the hammer against the anvil, the steel piece is brought under the hammer. At this moment, the forger takes up the piece, by a series of slow blows with the steam hammer removes the remnant slags, and then welds the porous spongy mass into a piece $1\frac{1}{2}$ feet long and 6 inches square. This done, the piece is returned to the furnace, and reheated and again forged under the hammer. The same process is observed with the three other pieces. This process having been repeated three times upon every piece, several of them are welded together to obtain the right weight, and then rolled into rails or spring steel.

As often as 400 pounds of steel have been worked out, the channel of the puddling furnace at the part where the fire goes to the chimney has to be repaired. This is done by the removal of the fire-bricks easily placed at the side, and by removing the cinder from the lowest part of the channel, which part after this is covered with wet sand. Meantime the draft is of course stopped off.

From what has been said, it becomes evident that the spring steel, now generally used for rails for roads where, particularly in regard to curves, great strength and toughness are required, is directly made from cast iron. Sometimes to get the best kind of steel, three kinds of cast iron are made use of, whereby the produced steel partakes of the good qualities of all of its components.

The steam hammers are like those made in England.

The Manufacture of Coke.

Only bituminous coal is used in the puddling process, and consequently the larger pieces are chosen for this purpose, the smaller ones being left to be coked.

The coking is very deliberately done in 118 ovens, to which 60 more have recently been added. Each oven takes about 240 Prussian sheffels, a measure not far differing from the American bushel. Thus the quantity of coal converted every 12 hours into coke, would make up nearly 40,000 bushels, provided the bushel be equal to a Prussian sheffel.

The coke ovens are a kind of square iron receivers with many small passages or culverts joining into one common channel which is connected with the chimney.

The operation of coking has to be interrupted when a small blue flame appears, at which moment the passages are shut up. Each oven is 30 feet long, 30 inches wide, and 4 feet high. Over these ovens rails have been laid for coal cars to run, and thus the ovens can be directly charged from the cars through an aperture, which is closed during the process of coking.

The coke is removed from the ovens by a machine consisting of a wheel, rod and crank. For the purpose of operating this machine, a locomotive is now being constructed. All the coke when taken from the oven is extinguished by water. The gas produced in these ovens has not yet been utilized, but in another factory of this country it has been used for heating the steam boilers.

The Casting of Cannon.

The casting of cannons is done in iron molds, the interior of which is loamed by means of a brush, and then perfectly dried. By this means the casting is prevented from sticking to the molds. The casting is done by emptying a sufficient number of crucibles, each containing 60 pounds, one after another, without interruption, into the mold. Near the ingot hole, the mold has a ring, so that by means of tackles it can be lifted, and while the ingot is red hot it is lifted and placed in a receptacle of mason work, the bottom of which is covered with coke dust, and finally the mold is covered all over with coke dust. The coke dust becoming red hot and burning, the piece is kept hot for several weeks, by adding fresh dust as it (the old) is consumed. After some months the steel piece having become cooled has then to be forged.

It is forged now under a hammer of 100,000 pounds weight. The anvil is angularly deepened, so that pieces of different calibers can be put on and worked. In this way the piece has a steady position. Turning the piece is effected by four cranes. Moving the piece backward and forward is also accomplished by a system of cranes.

The heating of the piece is done in a reverberatory furnace, to which it is brought on a railroad by a steam engine. As the heating of so large a piece of steel requires some time, two furnaces are in use at once, so that while one piece is being forged, the other is being heated up to save time.

Here too the reverberatory furnace uses bituminous coal.

The black lead or graphite crucibles used have a capacity of 50 to 60 pounds, are made

by hand, and cost about \$2. The iron molds are loamed inside and then dried at a temperature of 167° Fahrenheit; but before filling them they are exposed to a much higher heat. The crucibles are covered by a cover with a round bole of two inches, which can be closed with a stopper of clay. Through this hole the condition of the steel can be examined while under the melting process.

Twelve crucibles at once having been filled with rolled pieces of puddled steel, two inches in length, and charged with the necessary flux, are covered and placed in the ebafery, where they are heated by degrees. After two hours, they are put upon the stands or supporters of the melting furnace, surrounded with coke which, by the draft of the chimney (200 feet high) instantly ignites and brings the crucibles to a white heat. After a few hours, the steel, having become thoroughly liquid, is examined with an iron bar $1\frac{1}{2}$ inch thick.

When the steel runs from the bar emitting sparks, the operation is done. Then the channel connecting the furnace with the chimney is closed by the damper, and the crucibles lifted from the fire and brought to the molds. By a blow from below against the somewhat projecting cover, the latter is removed, and the slag being taken off, the steel is poured into the iron molds covered inside with clay, as before mentioned, for ordnance. The quality of the steel depends very much upon the good assortment of the stock which has been used. Krupp's furnaces are like those used by the English without blast.

Krupp's crucibles are made of clay from the Rhine and black lead, mixed and worked on the potters wheel at the place. The firebricks are also made here.

Making Steel Rails.

The rolls for making steel rails do not differ from the common ones for iron rails. These steel rails are made of puddled steel, being cheaper and containing somewhat less carbon than cast steel.

It must be mentioned here that these rails being cut to nearly the proper length, and being supported at both extremities, are turned on the ends by means of two turning machines. Before this turning, however, is attempted, the rails have to be straightened, and this is done by a strong screw press.

In Prussia, the connection of the rails is altered and effected by plates of wrought iron rivetted; thus expansion and contraction of the rail cannot do any harm.

The cupola furnaces in use, both for remelting cast iron and for iron castings, have a height of 30 feet by 8 feet diameter; the wall made of fire bricks being 20 inches thick. For melting the cast iron, coke with quicklime is used.

The tires are cast in loam molds, thoroughly dried and heated before using. The ingot is put while yet hot into coke dust, to keep it hot. After some days, heated to a high red heat, it is passed through rolls to condense and consolidate, instead of forging it, and then allowed to cool slowly. After having been turned it is again heated and put on the wheel, upon the periphery of which it becomes cool and light.

W. H. DAFIN.

Philadelphia.

[To be continued.]

Mexican Mining Words.

[Continued from page 211.]

Workmen and Employers.

El Dueno—The owner.
Los Operarios (Rayados) or Pueblo—The workmen of all kinds employed in a mine by the owner.

El Administrador or Amo—The Superintendent.

Un Perito—An expert.

Un Tenedor de Libros or Dependiente—A book-keeper, accountant or clerk.

Un Rayador—A time keeper, who also serves out tools, fuzes, candles, powder, etc.

El Minero—The head miner; also a man who understands mining.

El Interventor—The receiver of a mine (in a law suit).

Los Barreteros—The miners, or men who drill the holes and fire the blasts off. They work in pairs. The one who strikes is called *Golpeador*. They work by task almost universally, and will earn about \$10 to \$15 per week. They are paid so much for each hole, from 37½ cents to \$1, as the case may be, averaging 50 cents. They only work about 4 days in the week, and are great gamblers. Also are adepts at stealing ore. The miner points all the holes they drill.

El Pegador—The man who fires the blasts.

El Poblador—The under foreman.

Los Tamareros—The rock carriers—men in lieu of our wheelers. The only difference is that they carry out of the mine on their backs all the ore and waste rock. This is done in a leather bag, suspended from the forehead. In a large mine they go in gangs, hosed by a *Culero*. They receive 75 cents to \$1 per day.

Un Achichingue—A man who packs water out of a mine in a leather bag, *Bota*. Often work by contract, to keep a mine clear of water. This is a distinct branch, and is very dangerous and arduous.

Los Quebradores—The "sorters," or cleaners of ore. They receive \$1 per day, and are always the old miners who are too old to work any longer. They are good judges of ore (*Pintistas*). They separate the ore thus:—into *Gavarros*, pieces of ore from the size of an egg up to an apple; *Gramas*, chips of ore;

and *Tierras de Labor*, chips resulting from blasting, or *Tierras de Yunque*, dust and fine chips from the assorting block. The *Gavarros* go into the battery first, while the others go directly into the *Tokonas* (pans). The *Tierras de Yunque* are usually valued at one-half of the value of the *Gavarros*. The others are poorer.

Un Velador—A watchman.

Una Entrada—A shift of men going into a mine to work.

Un Adenador—A timberer.

El Maderero—The man who cuts and delivers timbers to a mine.

Maquinista—Mechanic or engineer.

Lapidarios or Gambusinos—Men who live by stealing ore and selling it.

Partidarios or Laboristas—Men who work a mine or labor on shares.

Buscones—"Chloriders."

Vetero or Rumberador—Prospector.

El Descubridor—The discoverer.

Accionista—Stockholder.

El Habilitador—The merchant who outfits a prospector, or furnishes tools, food, etc., to a *Partidario* to work a mine. On a large scale, he is called *Acidor*.

"Zorilla"—The boy who brings meals, carries tools, runs errands.

Un Liso—A slip.

Durango, Mexico.

C. B. N.

Gilpin County, Colorado.

From the report of the committee appointed to gather statistics relative to the traffic of Gilpin county, Colorado, we make a few extracts with regard to mining.

The bullion production of the county reaches \$2,500,000, averaging nearly \$500 to each man, woman and child. The ore production is estimated as follows: It is assumed that each 10 stamps in use consume 7 tons of ore; there being 853 stamps now employed, 595 tons of ore per day are required, or 178,500 tons per year. The consumption of wood is noted at 170 cords per day, or 85 tons of coal; for the mines and mills; the consumption of wood in stores, offices and dwellings in Central City, Black Hawk and Nevada is set down as 4,000 cords.

The following table is condensed from more special ones.

No. of mills.....	83
No. of stamps.....	1,597
No. of stamps running.....	853
No. of mill engines.....	86
(No. of horse-power used.....)	3,485
No. of hoisting engines.....	1,361
(No. of horse-power.....)	79
(No. of horse-power used.....)	312

It is estimated that the present capacity of the mines worked corresponds to 55,600 tons of smelting ore. Thousands of lodes have been discovered, of which over 300, averaging from 1,000 to 3,000 feet surface measurement, have been worked and assayed by the Territorial Assayer. There are said to be at least 60 miles of lode property, every foot of which can be pointed out, on which there are not less than 8 miles of shaft, varying from a few feet to 800 feet in depth, and over 16 miles of drifting, besides a very large amount of tunneling.

The total daily up freight for a railroad is estimated at 149 tons; down freight, 115 tons of smelting ore. Present passenger travel, 20 persons daily.

Withdrawal of Railroad Lands.

We find the following in the *Los Angeles Star* of the 10th instant:

The plat of withdrawal of the lands designated for the Southern Pacific Railroad purposes was received yesterday by the Register of the United States Land Office, accompanied by the instructions of the department. The diagram designates the route of said road, which is by the way of Tehachape and Soledad Passes, down the San Fernando valley to Los Angeles; thence to San Bernardino, through the San Geronio Pass and Cahuilla Valley to Fort Yuma. The breadth of land covered by the withdrawal is sixty miles in width, thirty on each side of the line, the odd sections accruing to the road, except where prior rights have vested.

Within the twenty-mile limits the even sections are increased in private to \$2.50 per acre, and an ordinary homestead under the act of 1862, can only embrace 80 acres. Between the twenty and thirty-mile limits the even sections are held at the old rate. The withdrawal takes effect from to-day, the date of its receipt at the District Land Office.

MINING SUMMARY.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

SCENECTADY.—*Miner*, May 13th: Capt. Moore, who has charge of the mine, informs us that he considers the late strike of more importance than any heretofore made.

RAISING.—The mill of the Monitor & Northwestern Co. is going up. This will be one of the finest mills in the country. It is so planned that the ore dumped at the level of the road, takes a downward course through the different machines with a very small amount of handling.

ELDORADO COUNTY.

GEORGETOWN Cor. of *White Pine News*, May 16th: The shipment of gold from Georgetown will aggregate a quarter of a million the present year, considerably above the last. Quartz and 'seam' mining now constitute the chief resources. Recently Bateman, McNevin, and others, who have made their fortunes in Eastern Nevada, have purchased the St. Lawrence quartz mine and are opening it with fine prospects. A few other claims promise well, and the finest inducements are offered capitalists. A singular feature in mining is the washing down of bed-rock by hydraulic, here called 'seam mining.' Several ranges of hills are composed of rotten bed rock of slate, seamed with numerous layers of quartz of various thickness ranging from an inch to twenty feet—all of which is so soft that it can be piped down with the aid of an occasional blast, and washed through a sluice. The gold seems to have been freed from its original matrix by decomposition, and is easily saved. The Whiteside claim, near Georgetown is one of this character. From this, with seventy inches of water, \$4,000 in a week has been obtained, and the general average is good. Woodside quartz mine, which created such an excitement, a few years ago, when pockets were found showing about equal parts of gold and quartz, is now filled with water, and lies neglected, awaiting the purchaser with capital and enterprise to open it. Mameluke Hill and Georgia Slide, from which many millions have been taken, are but masses of decomposed quartz and soft slate, and are by no means exhausted.

FRESNO COUNTY.

QUARTZ.—The *Mariposa Free Press* says: John Keegan and Martin Medley have brought in specimens of quartz from Spangled Gold Gulch, which are extraordinary for richness. The gold is coarse and in fantastic shapes, running through the quartz. The gulch is 30 miles from Mariposa.

INYO COUNTY.

OCOLA.—*Independent*, May 13th: The boys are into their ledge at last and find it a pretty good thing. We saw a twenty pound specimen of the black, splendid looking ore, which assays \$1,500 per ton. Drifts on both sides of the tunnel disclose bodies of the ore, and a ton was taken out on the first day.

LASSEN COUNTY.

BIG VALLEY.—*Yreka Union*, May 17th: Mr. McKendra, one of the firm of Enlers & Co., owners of the rich claim of Providence Hill, near Big Valley, reached Yreka direct from the claim, on Sunday. Rumor hath it that they have been offered \$250,000 for the claim by a San Francisco company.

NEVADA COUNTY.

WEBSTER.—*Grass Valley Union*, May 19: The Webster Co. cleaned up on Thursday, after a run of six hours, \$500.

LOCATED.—Same of 21st: The South Idaho Co. has located 20 claims of 100 feet each, on the Idaho ledge, to commence on the eastern boundary of the Idaho company's ground. The rich yield for years of the Eureka, and later from the adjoining claims of the Idaho, has made it a matter of surprise that the extensions have not been opened up long ago.

MEADOW LAKE.—*Telegram*, May 16th: The mines at Carlisle and Meadow Lake are improving. A large body of rich ore has been struck in the 190-foot level of the U. S. Grant mine at Carlisle. An 8-stamp mill is constantly at work. Ore of common grade yields \$30 per ton. The mill will be enlarged and a furnace attached thereto this season. The Pennsylvania company are taking out rock for custom crushing. Reduction works at Meadow Lake are to begin work in a few days.

PLACER COUNTY.

TWO THOUSAND DOLLARS PER DAY!—*Stars and Stripes*, May 18th: At Greene's mine between Auburn and Ophir, two and a half day's crushing last week, with four stamps and one Hepburn pan, realized 185½ oz. of retorted gold. This is at the rate of \$1987 per day and gives a total of about \$28,000 within the past month.

RATTLESNAKE.—At Bole's Ranch, above Rattlesnake, a part of the bar included in the claimed tract is worked as a mining claim by hydraulic process by Mr. Boles and the brothers Peter and Milton Cary. The channel of the mining ground covers about four acres; the "face" where they are now operating is about 25 feet in depth; being a body of lively looking gravel which prospects richly from the top to the granite. The present yield is seventy dollars per day. They use 11-inch iron supply pipe; have a fall of one hundred and ten feet and drive five hundred inches of water through a four-inch nozzle.

The North Fork Ditch is nearly full of water.

GREAT CREVICE MINING Co.—*Grass Valley Union*, May 20th: On the middle fork of the American river, at American Falls, a company, composed principally of Grass Valley men, have for a number of years past owned an extensive mining claim, in the effort to open which they spent many thousands of dollars, year after year. The Great Crevice Co. is incorporated to work a similar claim one mile below. The bed has not been approached for about twelve years, yet those acquainted with it were fully convinced of its richness. Within the past year or two, however, a new mode of river mining has been discovered, which consists of sinking a large iron tube (five feet in diameter) into the gravel bed until solid bottom is struck; then excavating in and around this tube, and tunneling under the river. This will be the plan adopted here. One thousand shares at \$5. will be sold to enable them to erect the works.

PLUMAS COUNTY.

MORE STAMPS.—*Quincy National*, May 12th: The Argentine mines are being developed quite rapidly, and there is no doubt in regard to their richness and permanency. We are informed that another battery will soon be added to one of the mills.

SIERRA COUNTY.

ITEMS.—*Messenger*, May 20th: Several strangers are looking at quartz in this vicinity... The Bald Mountain Gravel Co., of Forest City, have struck a streak of gravel in their tunnel... The Hawkeye Co., at Howland Flat, had a cave last week... P. Grant has struck very rich rock in the old Leonard mine, now owned by him.

WOLF CREEK MINE.—*Sierra Age*, May 20th: A. Chappius & Co., have got their 8-stamp mill in operation and are crushing excellent rock.

TRINITY COUNTY.

NORTH FORK.—Cor. of *Journal*, May 20th: There are good reports from Rattlesnake—the miners all doing well. Brown's creek and the upper North Fork are attracting the attention of miners. Nine men have already gone that way, and more probably will go.

CANYON CITY.—Cor. of the same: Mining goes on with results generally good. O. L. Slack & Co. are constructing a car to run in their bed rock tunnel. The track will be eight hundred feet in length.

Two sales of mining claims have been effected within the past week. Mr. D. McEllduff has purchased the Clothier claims, on Hykes Hill, for \$250, and Mr. Jos. McGillivray has bought John Franklin's claim, paying \$200 dollars therefor.

Nevada.

ELY DISTRICT.

QUARTERLY STATEMENT.—The *Record* for May 14th gives the County Assessor's statement for the quarter ending with March. We copy totals: Tons of ore worked, 7,204. Amount bullion produced, \$697,549. Average per ton, \$96.82. The *Record* thinks that over \$500,000 was lost for want of Stetefeldt furnaces; since with them 85 per cent of the silver could be saved instead of 50 per cent as now.

BULLION.—Wells, Fargo & Co. shipped, on May 12th and 14th by way of Salt Lake bullion valued at \$11,717.05. On May 17th: For Barnum W. Field 9 bars valued at \$7,922.02; for Meadow Valley, 5 bars valued at \$6,099.83; for Raymond & Ely Co., 8 bars valued \$12,303.15. Total \$26,325.

OTHER MINES.—Same of 18th: Aside from the well-known mines on Spring Mountain, claims have been located on the other side, in an easterly direction, for a distance of five miles. Within two or three weeks a

number of these have been started up, and veins of extraordinary richness developed.

ESMERALDA.

PINE GROVE.—*Enterprise*, May 20th: The Wilson mine is the only one at present actively worked. Owing to want of capital and bad management most of the mines and mills in the district are lying idle. Many of the inhabitants have moved to other districts, and the place is full of empty houses. The King mine, at Rocklin, five miles southeast, is shut down principally on account of the inefficiency of the mill. They have a lead three to four feet in width, and their ores pay \$30 to \$50 per ton, but mismanagement has swamped them. Scarcely a mine in the region has been properly opened, yet the whole country has been scratched over. A lead called the Salt River, six miles northeast of the town, contains pockets that are immensely rich in free gold and black sulphurets of silver. Our informant brought in a specimen from this lead, which contains some two ounces of pure gold, yet the whole lump scarcely weighs three ounces. The lead varies in width from a few inches to three or four feet. The man who owns it works the ore in a hand mortar. Near it, on Salt river, another vein was found a few days ago since which yields \$200 per ton.

EUREKA DISTRICT.

RICHMOND.—*Sentinel*, May 20th: The Richmond Co., on the 17th inst. made one "tap" of bullion weighing 5,028 pounds, which when assayed gave a value of \$1,614.52 per ton.

HUGE.—We saw, at the Empire mine of the Phenix Co., a solid piece of ore 5 feet 6 inches in length—3 feet wide and 20 inches thick. A piece had been taken from each corner and assayed, and it gave a result of \$268 per ton.

SILVER WEST FURNACE.—Thomas J. Taylor has sold his furnace to the Phenix Co. They will proceed at once to arrange the buildings. A No 5 Sturtevant blower and Blake's crusher are on the road. This furnace will be as fully equipped as any in the district, and will be under the supervision of Charles Von Liebenau.

HUMBOLDT.

ARIZONA MINE.—*Silver State*, May 20th: For some days past the ore extracted has improved in quality, and the quantity of first-class ore shipped for treatment, has materially increased. We understand that the machinery for the new mill of the Arizona Consolidated Co. for the working of tailings, has nearly all arrived from the foundry. The company expect to have it running by the first of June.

RELIEF DISTRICT.—Cor. of same: The Black Knob Co. have commenced work on their ledge, half a mile south of the Central Pacific mine. They have a fine ledge of mineral, three feet in width; in fact, it is the richest vein in the district yet developed. They are sacking ore to be shipped to the Auburn Mills, Reno. The Silver Star lode, owned by Thos. Voorhies, soon to be opened, shows very good float. The Batavia and Pacific Co. have men employed laying water pipes from a spring in the Black Knob Valley to the mill site.

RAILROAD DISTRICT.—The *Elko Independent* of May 20th gives notes of a trip through the district. The Humboldt ledge shows the largest body of ore. The Last Chance is nine feet in thickness. The Lincoln has a 3-foot ledge of ore averaging \$80 per ton. The True mine gives working prospects of \$100 per ton without any particular selection. The Tripoli has a large quantity of ore sacked for shipment. South Fork has four feet of good ore. The California has a 5-foot ledge of solid ore. So has the Orphan Boy, belonging to the same Co.

RESE RIVER.

BELMONT.—*Renoille*, May 16th: Yesterday we heard that a lot of El Dorado South ore—something like two hundred tons—was about being hauled to the Manhattan mill for reduction.

THE CITIZEN'S MILL.—Everything connected with the mill thus far, has progressed satisfactorily; the machinery is being put together rapidly.

WASHOE.

OPHIR.—*Enterprise*, May 21st:—At present no work is done in the underground works except in the bottom of the shaft, preparatory to putting in a new pump. The machinery is on the ground.

YELLOW JACKET.—This Co. are taking out 170 tons of ore per day, which mills \$36 per ton on the average. They are preparing to start their incline on the 1,200-foot level. The drift north on the 1,100 foot level is pushed vigorously.

CONSOLIDATED VIRGINIA.—The drift south from the main west drift was yesterday in 45 feet, in quartz that is gradually improving. The north drift is still in very

hard rock. There is no water.

SEGREGATED BELOHER.—Taking out 12 to 15 tons of ore per day from the east body. A prospecting drift is being run toward the Belcher linc, distant 50 feet.

SIERRA NEVADA.—Having purchased the Kenosha mine, this Co. are freed from the injunction, and both mine and mill are in full operation. They have not yet commenced mining in the Sacramento and Meredith portion.

SUTRO TUNNEL.—The Tunnel was in last evening 1,981 feet. The ground is now such that excellent progress is made.

LADY BRYAN.—The mill has been in constant operation during the week, and the mine is looking well. A deposit of ore, rich in chlorides and showing free gold, was yesterday found upon the 80-foot level. The prospects are very promising.

KENTUCK.—This Co. are taking out 30 tons per day, which is reduced at the Excelsior mill. The Gold Hill mill will be started up during the week. They are now able to extract ore from the old burnt district between the 600 and 700-foot levels. Although the fire occurred two years ago the rock in many places is as hot as to burn the naked hand.

CHOLLAR-POTOSI.—During the week 1,670 tons of ore have been extracted, 1,560 of which, assaying \$25.25 per ton, have been sent to the mills. During the week they shipped \$67,000 in bullion.

OVERMAN.—The Co. are taking out 35 tons of ore per day from the 226-foot level, which is being worked at the Devil's Gate mill.

CALEDONIA.—This Co. are now taking out nearly the usual daily amount of ore.

DANEY.—A letter from the Supt. says:—The south drift is in 26 feet. The north drift is 20 feet in the vein, which appears to be well defined on this level. The vein looks encouraging in every respect.

SAVAGE.—Extensive repairs are yet to be made on the shaft. About 120 tons of ore are daily extracted. As this is from several different grades of rock, the average for the week has not reached expectations.

HALE AND NORCROSS.—The yield of ore per day is about 115 tons.

GOULD AND CURRY.—We understand that the work in and around the shaft, and on the tanks and bob-pits, is prosecuted vigorously, and the requisite preparations for prospecting at a greater depth are made with a view to permanence.

BUCKEYE.—The Co. are pumping out the water from the lower works, using a Blake's Patent Pump which throws twenty-four inches of water.

IMPERIAL.—The situation of the mine is no worse than was that of Crown Point before the grand strike.

SUCCOR.—Owing to bad air in the farther end of the main tunnel no work is being done there.

HOPE.—This mine has passed into new hands and is again being worked—this time in a manner, it is thought, that will make it a paying concern.

The *Carson Register* of 21st says: The mines on the eastern side of the river, five miles from this city, are looking better every day. Assays from one claim show \$205 in gold and silver to the ton and fifty-six per cent. of lead.

SIX-MILE CANYON.—The *Gold Hill News* gives a full and interesting description of Parke & Bowie's tailings mill, Lady Bryan mine and mill, and the Gould & Curry mill. The latter, a conspicuous monument of past greatness, is, like its mine, empty. The Lady Bryan mill is substantially built, and its machinery of the most approved description throughout, Parke & Bowie's mill is arranged in the most perfect labor-saving style, and works 100 tons of tailings per day.

WHITE PINE.

REVIEW.—*News*, May 20th: The tramway is now in successful operation, running day and night, transporting from the Ward Beecher mine to the International mill about 125 tons of ore per day. The machinery for the steam hoisting works of the Beecher is on the road. At the tramway station of the Beecher 30 men are employed, on the night and day shifts, in breaking down the ore from the immense dumps, and sacking and shipping it. All over Chloride Flat and in the vicinity of the South Aurora, a busy scene is presented, men being at work on nearly ever location. Recent developments show that there is an immense quantity of lowgrade ore on Chloride and Pogonip Flats and in the immediate vicinity; and work on several mines, which have been idle for some time, has been resumed with vigor.

ITEMS.—Ward Beecher hoists daily from the Autumn shaft 40 tons of ore worth \$70. per ton. Same amount of good ore from the Buchanan shaft... North Aurora is now in a large body of ore. As soon as

track and platform are completed, will ship ore by tramway to mill. North Iceberg has out 5 tons worth \$160. per ton. Eberhardt ships 20 tons daily to International mill by tramway. It is found that the main body of ore in South Aurora has not yet been worked. Working 100 men and shipping ore by team to Stanford mill. Original H. Treasore works 40 men—all they can get. Sorting ore for shipment. Ward Beecher Consolidated hoists 18 tons \$55-oro daily. Chloride Flat Co. ships 30 tons daily to Stanford mill. Silver Wave will shortly commence shipping. Virginia is shipping ore to Big Smoky mill. Of the base metal mines, Trench has 30 tons reducing at mill which gives \$600 pulp assay. Now in body of ore 5 feet thick. Crown Point, on Bullion Hill, has struck a magnificent body of high-grade base ore.

OUTSIDE DISTRICTS.—A lot of Tem Pinte ore worked \$404 at Big Smoky mill. A lot from the Pago and Corwin mine, Secret Canyon, worked \$799. A lot from the Allen mine, Kern District, went \$263. The machinery for the Troy mill is all on the road.

MILLS, ETC.—The mills running are Big Smoky, 20 stamps; Stanford 30; International, 60; Oasis, 10. The Manhattan and Dayton are repairing. Alsop furnace is running steadily on Imperial ore.

Arizona.

BRADSHAW.—Prescott *Miner*, May 12th: At last accounts the original Tiger Co.'s shaft was down 35 feet, at which depth the vein of black sulphurets of silver was all of three feet thick, and careful as Captain Fleeson is, he has asserted that said sulphurets will pay \$8,000 to the ton. Water was seeping in very fast. No side walls were visible, although the shaft is pretty wide; nothing but ore on every hand, and all of it rich. Riggs & Co., owners of the 2d Extension South, on the Tiger, had penetrated to a depth of 25 feet in their new shaft, which is 40 feet from a point where their lode is fully 16 feet thick. As soon as they reach the water line, they will commence tunneling for the lode. South of them, Stuhlfeld, Knott & Co. were running an open cut in their claims and taking out plenty of rich ore, which was being assorted by Mexicans, who are, by this time, smelting it. One of the companies on the Gray Eagle lode, had 12 feet of good ore, containing free silver and black sulphurets in abundance.

OTHER DISTRICTS.—News from Big Run, Walker, Hassayampa, Weaver, and other mining districts, in this vicinity, is good. In Walker district Shelton is arastrating partially decomposed Vernon ore that will pay \$1,000 to the ton. The Thunderbolt mill was at work on silver ore from the Davis mine, Hassayampa district. Uncle Pilly Pointer has crushed about 25 tons of Pointer ore, which paid \$50 to the ton.

Colorado.

GEORGETOWN.—*Miner*, May 18th: The Baker mine is producing \$175 ore. The Kilwinning, Republican mountain, is producing very rich ore. Our mills are constantly and fully supplied with ore. The Stewart Reducing Co. have shipped since our last issue, silver hullion, \$3,824.62. The Briggs mine, is producing a good quantity of rich ore. The machinery for the Arey furnace has arrived. Several rich discoveries are noted during the week. All by poor men. Palmer & Nichols Reduction works have as much work as they can do. Total hullion shipment for the past week by this Co., is \$3,924. Work on the O. K. lode goes on, and rich mineral is found. Ore from the College lode gave 232 ozs. per ton. The Burleigh Tunnel has cut another vein further in; it is a four-foot crevice. The ore assays 65 ozs. silver per ton.

"FLOAT ORE."—Mining for float mineral, in the slide on Leavenworth mountain, continues with success. The ore has been traced to a point above the Equator lode, and it is evident that the mineral has been broken from veins which have already been cut, and are now owned by the Marshall Tunnel Co.

ENGAR.—This lode, in Spanish Bar District, has been purchased by a Kentucky Company. It is one of the largest and richest in the country.

Idaho.

BOISE COUNTY.—*World*, May 11th: Several days ago we made a flying visit across the Basin, visiting Centerville, Placerville, and Granite Creek. We found no idle men at any of the camps, and as the ditches are running full of water there is more work going on than for several years past. From a friend just down from Pioneer City we learned that water had been turned into all

the ditches, and that place appeared to be the liveliest camp in the Basin. Operations around Idaho City are carried on actively. Mr. Plowman has started hydraulics on the bar opposite the claims of Tompkins & Lanning, with all indications of its paying well. All claims having water on them are run night and day. Though the season opened rather late we will have a lively one. The Gold Hill Co.'s mill, near Quartzburg, after a run of two weeks, cleaned up \$15,000.

BULLION.—*Avalanche*, May 13th: Wells, Fargo & Co. shipped from here this week 7 bars of bullion, valued at \$17,203.

Montana.

The Bio Ditch.—*Helena Gazette*, May 15th: This and other Ten Mile ditches are affording an ample present supply for the wants of Last Chance. Ten Mile creek is very high. Miners are scarce in Last Chance gulch, and hands are in demand at all the mining claims still owned by white men. The Chinese are monopolizing most of the lower portion of the gulch.

PARK DITCH.—A large head of water is running. About half a dozen companies are sluicing in the Park, and many others are making preparations to start up in a few days. One hundred inches will be turned into Nelson Gulch this morning, where it will be used by several successive bed-rock flumes.

HIGH WATER IN CONFEDERATE GULCH.—Mr. John Moffatt, who has been bringing up a drain to his ground in Confederate gulch, informs us that all the miners in the head of the creek were this week compelled to cease operations on account of the immense amount of water. Moffatt states that in running up his drain and working out the breast this spring, he cleaned up \$3,342. D. P. Rankin, who owns No. 8, just above Mr. M., has we learn, struck some rich prospects in his ground, but was compelled to quit work.

RADERSBURG.—Cor. of same: The two mills here and the little one at Warm Springs, are pounding away on rock from the Keating, Ohio and Ironclad lodes. About two hundred men are employed in the mines. It is demonstrated that the Ironclad is one of the richest of lodes. The Keating was long since ascertained to be rich and extensive. The same is the case with the Ohio. Mr. Nave is going to build a twenty stamp mill this summer, to crush rock from the Ironclad. Everybody is busy here. Mr. Quinn, proprietor of the ditches, is furnishing 1,500 inches of water to the miners on the hars, and four or five thousand inches more are running in Crow Creek. Miners satisfied with from three to eight dollar diggings can have them here, and plenty of water for the summer.

GOLD DUST.—*Herald*, 18th: S. F. Molitor informs us that he purchased four hundred ounces yesterday, most of which was from Last Chance and Oro Fino gulches.

THE I. X. L. MILL.—We learn from Mr. J. C. Ricker that his mill will start up again in a day or two and keep running during the season. Three hundred tons of ore are already on the dump.

THIRTY DOLLARS A DAY.—Young & McDaniel after a run of thirty hours on Golden Bar, at the head of Grizzly Gulch, made a clean up, Saturday night, of twelve and a half ounces, or about \$230 in gold dust. This was the first clean-up of the season from Park Ditch water (25 inches only having been used,) and is an average of thirty dollars per day to the hand.

New Mexico.

SILVER CITY.—Cor. of Santa Fé *Post*, May 13th: Several new and rich discoveries of silver leads have been made in this vicinity. Workmen in an extension of the Legal Tender lode have struck ore of fabulous richness and yesterday similar ore was found in a new lode between this and Chloride district. Numerous small furnaces (on the Johnson plan) are being erected in every direction, and a considerable quantity of silver is being taken out daily by the Mexicans who run the only smelting furnaces now in operation. Work will soon be recommenced in the Chloride district. Among the richest lodes are the Providencia, Belknap, Adelaide, Red Rover and Gran Tesoro, as also the Siemena. About the most extensive lode yet discovered is the Princeton, situated between this district and Chloride. This lode is nearly 40 feet wide and crops out 10 feet high above the ground. The mine has not been worked as yet.

RICH ASSAY.—S. F. Molitor publishes a certificate of assay made by him of ore from the Algonquin lode on Flint Creek. The gold coin value per ton showed \$6,472.04.

Mining Stock Market.

(S. F. Stock and Exchange Board.)

SAN FRANCISCO, Thursday Eve., May 25.

The stock market has been irregular and rather weak during the past week. The most noticeable feature was the fall in Chollar-Potosi, this stock coming down to \$45 on Monday, the lowest for six months. The company has paid dividends to the amount of \$1,120,000 this year. Amador was quoted at \$305 on Friday last, a fall of \$30 from the previous quotation.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week:

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING MAY 9TH.

MANUFACTURE OF ILLUMINATING GAS.—Samuel Hevner, San Francisco, Cal.

BUCKLE.—John F. Martin, Harrisburg, Oregon.

WATER-WHEEL GATE.—Perry W. Davis and Dennis D. Burnell, Portland, Oregon.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency the following are worthy of notice.

IMPROVED SAFETY FUSE.

R. Uren, Santa Cruz, Cal. The object of this invention is to produce a safety fuse which can be manufactured at a less cost than the ordinary fuse heretofore made. The article in question is composed of only two layers of material, instead of three. Its manufacture is accomplished by means of a machine previously patented by Mr. Uren and others. In the ordinary method of manufacture, it is necessary, while twisting the first or main rope (inside of which the powder is confined), to twine around it, in an opposite direction, one or more strands or yarns, called counter yarns, in order that the rope shall not untwist when taken from the drum upon which it is wound in preparing and covering it with the tapes. With the machine above mentioned, it is possible to dispense with winding with the counter yarns, and thus the expense of this operation and material are saved, while an equally durable and effective fuse is obtained.

CARBURETTER FOR AIR.

L. Marks, S. F. This machine consists of a vessel, to the lower portion of which is fixed a series of shallow, oppositely-inclined boxes, connecting with one another. Gasoline, or other suitable oil, is placed in the upper box and immediately fills the inclined series. Air is driven into the lower box and forced to follow the inclined boxes, through the gasoline, up into the upper tank, whence it is drawn off for use, having become saturated with the vapors during its passage over the oil. The device is cheap and simple, occupies but little space, and is said to act very well in preparing the air for illuminating purposes.

GARDEN SPRINKLER.

J. I. Spear, S. F. This very neat and effective sprinkler has a hollow annular rim, of triangular cross-section, the upper face of which is rounded from the inner to the outer edge, and perforated with numerous small holes in the manner of any ordinary sprinkler. To the lower side of the rim, pipes or hollow arms are secured at equal distances, and converge to a central hollow boss which is attached to the hose by any suitable means. Any number of these arms may be used, or two V-shaped rings, one placed inside of the other with a space between them, may be used to connect the boss with the rim. The sprinkler stands in a vertical position

when in use, and throws a spray or shower of water in all directions, evenly wetting the ground in every part, and, while acting much more effectively than the common sprinkler, forming a very neat ornament.

Editorial Notes Eastward.—3.

As we continue on, we are continually catching ever varied and beautiful views of the American River, which twists and turns and tosses through the roughest and the wildest and the grandest of places. Now it is in plain sight below us, and now a turn or an intervening rise of the ground conceals it, as we pass on our serpentine path, over a ledge on the face of the mountain or into a low cut in its sides.

GIANT'S GAP, American River.
208 miles from San Francisco.

Everywhere are rough rocks, high mountains, deep ravines and green trees.

With a shriek we dash into darkness,—into the first tunnel we have yet met, which is burrowed through Grizzly Hill, aptly named. We pass through darkness and smoke, and before we have well accustomed our eyes to the changed condition, we are again in daylight. We come to Blue Cañon, blue with the light smoke rising from the many fires of the hardy

conqueror of Nature, and the deepest love of Nature, who could appreciate the scene in the days of the stage coach and of the prairie schooner.

We are now getting well up in the world. At Cape Horn we were thirty-five hundred feet above the level of the sea. At Emigrant Gap Ridge we were nineteen hundred feet higher, having risen this distance in the space of eighteen miles. We are rising up into regular Alpine scenery, and soon we shall be at a height where the snow comes in heavy drifts, and where the greatest ingenuity and skill of man is required to contend against the immense obstacles which Nature's forces present to his progress. But man shows himself the

WEST PORTAL TUNNEL No. 1.
215 miles from San Francisco—Altitude 4,574 feet.

conqueror of Nature, and comes out victorious in all the contests.

San Gorgonio Pass, San Bernardino County.

A correspondent of the Los Angeles Star says:—It (the San Gorgonio Pass) is an immense plain, ten to fifteen miles wide, extending before us further than the eye can reach. We had entertained the idea that this famous pass was a narrow gorge in the mountain, hence the scene which

of high cultivation, if water were supplied.

About three miles from where we stood, a fine stream of water rises in the hills, and after supplying Moore's ranch, makes its way out upon the desert. Still farther on, another stream irrigates an Indian settlement, the Potrero, which yields abundantly to the culture of the occupants. This is the last vestige of vegetation; all beyond is a sandy waste, down to the White Water River, a distance of some twenty miles, over which we saw a team slowly dragging its weary way, and over which the stage from Arizona had just passed. Passing down the plain to where the foot-hills run out on the desert, and turning towards the south, the Cabeson valley opens up, from which, to the Colorado, at Fort Yuma, there is not a hill or obstruction of any kind, and so gentle a descent, that in riding over it one cannot perceive the inclination. This is the nearest and cheapest route for the construction of the southern railway, as the surveys will, no doubt, eventually prove. It was on this desert the people of San Bernardino some years since sunk the wells which proved so useful to the immigrants.

Passing down this desert from Chapin's, about twenty miles, and leading in a northeasterly direction, the Morongo Pass opens up, which leads to the Colorado at Fort Mojave, or the Needles, the route by which it is proposed the thirty-fifth parallel road should enter California. This is another open plain, and offers the greatest facility for railway construction.

We may notice certain projected improvements by which it is intended to utilize the White Water River, by leading it from its desert course over the plains of the San Gorgonio Pass. This river rises in the San Bernardino mountain, near to the source of Mill Creek, (we think,) which runs west, while the White Water runs easterly, useless course, and loses itself among the desert sands of the Cabeson Valley. It is proposed to take out this water, and by ditch and flume, for some nine or ten miles, making use of natural water courses, bring it upon the lands near Dr. Smith's, and there found a colony.

The idea is a grand one, but it is as yet in an undeveloped condition, but the preliminary surveys are being made to test the practicability of the plan.

The oldest stove probably in the United States, says *Appleton's Journal*, is the one which warms the capitol at Richmond, in Virginia. It was made in England in 1770, and warmed the House of Burgesses for sixty years, before it was removed to its present location, where it has been for thirty years. It has survived three British monarchs; has been contemporaneous with four kingly monarchies, two republics, and two imperial governments in France. The great American republic has been torn by internal strife,

the breach partly healed, and still the old stove remains the same, unmoved in the midst of all.

ARTESIAN WELLS.—A Watsonville correspondent of the *Alta* gives the following as the cost of sinking artesian wells at that place. "Boring,—first 50 feet, 50 cents per foot; second 50 feet, \$1; third 50 feet, \$1.50; fourth 50 feet, \$2.; and so on in proportion to the depth. Pipe for the well costs 75 cents per foot. A well 150 feet deep will cost, including incidental expenses, such as breakage in pipe, etc., about \$275."

OXFORD UNIVERSITY is said to have had 7,000 students during the last term.

AMERICAN RIVER.

EMIGRANT GAP RIDGE.
222 miles from San Francisco—Altitude 5,574 feet.

wood-cutters, who are engaged in getting lumber for the varied wants of the coast. In the vicinity are numerous mills, which fashion into proper shape the huge trunks, and prepare them for the builder.

Soon we run along along an extended ridge, Emigrant Gap Ridge, so called from the fact that here the road traversed by the old emigrants crossed the divide. This road we shall often view again on our way, and it will recall the weariness and vexation of flesh of former days. The view here is very fine, and the ease of traveling now enables the laziest of mankind to enjoy it. But he must have been possessed of the strongest of limbs, the most indom-

opened on us, and expanded in grandeur as we proceeded, took us wholly by surprise. We saw before us a vast extent of country, apparently as flat as a table, wide as the eye could reach, bounded on each side by a lofty range of hills, which, on the right, run up to the San Gorgonio Mountain, and receding toward the desert into low sandhills, as did also the hills on the left. On our left, going out, we pass the ranch of Dr. Edgar, known as the San Gorgonio; next to it the ranch of Dr. Smith, said to be on the divide of the pass; and, three miles further on, the Chapin ranch. Here, ascending a steep hill, with a field-glass, we examined the country down as far as the valley of the White Water, which presented the same characteristics of a dead level plain, barren as the desert, but, as were informed, capable

POPULAR LECTURES.

The Study of Modern Languages.

[Prof. Paul Pioda before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Fifth Series. Reported expressly for the PRESS.]

LECT II. May 20.—The Professor commenced his lecture by remarking on the universal and imperative demand for the introduction into our public schools of instruction in the modern languages. That this demand was founded on the best of grounds, his previous lecture had tended to show. To-night he was to remark on the best methods of conveying that instruction.

It is only within a few years that this study has been introduced into the grammar schools of the principal cities of the Union. Before this, it was treated as a sort of practical superfluity, or rather as an exotic. But in this short time much progress has been made in the methods of teaching. To Manesca belongs the credit of having introduced a new and improved method, which has been followed to a greater or less extent by all subsequent grammarians. But Manesca was all practice, and his predecessors were all theory. The true way is to combine theory and practice properly.

Now the manner of acquiring knowledge varies with age, character, etc. An adult must be taught in a different way from a child. A man of mature age is able to grasp rules and theories, but as habit is the greatest enemy in the acquisition of the phonetic element of a language, he cannot expect to get the accurate pronunciation of a native. Certainly not, unless he is willing to devote a very great amount of time to the study. With adults, the most essential condition of success consists in the personal activity of the students themselves. The students must work hard, while the teacher is to be used only to guide, explain and stimulate.

Prof. Pioda's Method for Children.

With children, it is different. Here theory must give way to practice, books to personal instruction. Place a collection of rules and theories before a child, and the only result will be, if any, a torn and mutilated book. A child is helpless, dependent in everything; he must be taught orally, by objects, talks, little histories, which will interest it; and for short periods at a time.

Prof. Pioda elaborated at length his system for schools. He objected to the one-hour system (giving lessons to children one hour at a time, twice or thrice a week) as valueless. Arithmetic, geography and all other branches of juvenile instruction can be learned as well in one language as another. Therefore let there be primary schools where all the instruction is given in one foreign language, others in which it is given in another. A young child can be sent to a school for two years where French, for instance, is spoken, where all the instruction is given in this language. Then, for a couple of years, to a German school, where, however, he continues his French by the one-hour system. Or he may learn German first, and then French. This is only the general idea of the Professor's method. By it children will have acquired a foundation in the languages which will be firm and lasting, and on which the superstructure may be elaborated hereafter.

There is no fear that an American child will suffer as to his mother tongue by such a method. All the time that he is out of school, he will hear English spoken, and he will grow in this language equally with his pace in the others. There is one school on this coast where this method is pursued. The Lafayette Grammar School at Oakland, has a class of 40 or 50 children who are taught the common branches pursued in such a school in French. The Professor had requested prominent teachers and others to examine these children in English, and they reported them as sound in this language as the children in the schools where English only is taught.

The Professor spoke at length on the different points of the matter, upholding and explaining fully. This lecture terminates his series. The next three lectures will be delivered by Prof. W. F. Welcker on,—1st, General Considerations of the Science of Mathematics; 2d, Descriptive Geometry; 3d, Historical Sketch of Small Arms.

California State Fair for 1871.

The State Fair for this year commences at Sacramento on the 18th, and ends on the 23d of September. The Board of Agriculture are determined that no exertions on their part shall be wanting to make it in every department worthy of the State.

The premium list is a great improvement over any that has heretofore been issued by the Society, and decidedly more liberal than the average of premium lists offered by other States.

Over \$20,000 cash is offered in specific premiums, and under the clause, that "liberal premiums, will be given for all worthy articles exhibited not named in the list," this sum is largely increased. The Society will keep this promise good, so that any parties who may have any articles they consider worthy are invited to exhibit, and will be awarded just as valuable a premium if found worthy, as if a premium had been specially named for it. This clause will cover all new inventions and discoveries made after the issuance of the list and before the Fair, and is a direct encouragement to inventors.

We congratulate the mechanics of the State that the highest premium affixed in the entire list is in the Mechanical Department; and we extend equal congratulations to the agriculturists that that premium is offered for an agricultural machine—\$200 for the steam plow. The premiums for plows are numerous and liberal, and will be more specially noticed in our next issue.

The next highest premium is a silver pitcher worth \$150 for the best stallion of any age. There are five \$100 cash premiums, one for the best mare of any age; one for the best bull; one for the best thoroughbred sire with not less than ten of his colts; one for the best herd of cattle of any one breed, not less than ten, owned by any one person; and one for the best general display of fruit, embracing best and greatest varieties. In the department of fruits there are three \$40-cash premiums, one for apples, one for pears, and one for grapes. In the same department there are seven \$20-cash premiums, and ten \$10-cash premiums. The fine arts are well cared for in the list, there being four \$50 and four \$20-cash premiums offered in this department, besides many smaller cash premiums, and a large number of diplomas. In the floral exhibition, \$100 is divided into three premiums:—For best miniature flower garden; for best display of cut, and for the best display of growing flowers. A very large number of premiums is offered for vegetables, the largest being \$50 for the best and greatest variety of vegetables raised by any one exhibitor.

For the exhibition of wines of different kinds, \$200 is appropriated, and \$60 for sugars made of beets, cane and melons; \$50 is offered for the best exhibition of the silk business, and \$50 for the greatest number of useful forest trees planted during the year in permanent plantation.

For the best exhibitions of wooden ware, \$50 will be given, and \$20 each for the best grand, square and bonoir pianos; \$50 each for the best display of woolen and cotton goods, and \$20 for the best five yards of silk cloth, is offered; \$50 is proposed for the display of agricultural machinery; \$50 for the best horse; \$50 for the best steam engine, and \$50 for the best exhibition of general machinery. For the best two-horse family carriage \$30 will be given; for the best one-horse \$25, and \$20 for the best buggy, \$15 for the best farm wagon, and \$15 for the best trotting wagon.

We have named the above premiums to show the fairness with which all classes of exhibitors are treated in the distribution of favors. No industry has been overlooked, and none can complain of a want of due consideration.

ACCURATE SURVEYING.—The U. S. R. R. and M. Reg. says that, in the Hartz Mountain mines of Germany, surveying of the most difficult kind, through crooked underground ways, was carried out, on a certain occasion, for nearly five miles and came out exact to within an inch and a quarter.

GOOD HEALTH.

Effects of Colors on Health.

From several years' observation in rooms of various sizes, used as manufacturing rooms, and occupied by females for twelve hours per day, I found that the workers who occupied those rooms which had large windows with large panes of glass in the four sides of the room, so that the sun's rays penetrated through the room during the whole day, were much more healthy than the workers who occupied rooms lighted through very small panes of glass. I observed another very singular fact, viz: that the workers who occupied one room were very cheerful and healthy, while the occupants of another similar room, who were employed on the same kind of work, were all inclined to melancholy, and complained of pain in the forehead and eyes, and were often ill and unable to work. Upon examining the rooms in question, I found they were both equally well ventilated and lighted. I could not discover anything in the draining of the premises that could effect the one room any more than the other; but I observed that the room occupied by the healthy workers was wholly white-washed, and the room occupied by the melancholy workers was colored with yellow ochre.

I had the yellow ochre all washed off, and the ceiling and walls whitewashed. After making this discovery I extended my observation to a number of small rooms and garrets, and found, without exception, that the occupants of the white rooms were much more healthy than the occupants of the yellow or buff colored rooms; and I succeeded in inducing occupants of the yellow rooms to change the color for white-wash. I always found a corresponding improvement in the health and spirits of the occupants. From these observations, I would respectfully drop a hint to the authorities of schools, asylums and hospitals, to eschew yellow buff, or anything approaching to yellow, as the grand color of the interior of their buildings.

The following are some of the things not generally appreciated about a house: 1. The benefit of thorough drainage and water supply. 2. The benefit of good heating and ventilation. 3. The benefits of proper color.—*Cor. of the Builder.*

To the above may be added, facilities for admission of light.—*ED. PRESS.*

HARD AND SOFT WATER.—Dr. Letheby considers moderately hard water better suited for drinking than that which is very soft—an opinion which is confirmed by that of the French authorities, who took the Paris water from chalk districts instead of from sandy strata. He also stated that a larger percentage of French conscripts are rejected from soft-water districts than from neighborhoods supplied with hard water, and that English towns supplied with water of more than ten degrees of hardness have a mortality of four per one thousand less than those whose inhabitants use soft water.

REMEDY FOR THE TOOTHACHE.—The following application is said to be a prompt and generally efficient remedy for toothache, or neuralgic affections arising from teeth in any state of decay:—Saturate a small bit of clean cotton with a strong solution of ammonia, and apply it immediately to the affected tooth. The pleasing contrast instantaneously produced in some cases causes a fit of laughter, although a moment previous extreme suffering and anguish prevailed. A correspondent of the *Scientific American* says he has used the remedy for over one year, and obtained sufficient proof of valuable results to warrant its publication.

DISINFECTANT.—Sick and other rooms may be promptly and readily disinfected by placing a portion of carbolic acid in a porcelain dish, and float it in a larger vessel of hot water, to produce a more rapid evaporation. The disagreeable odor of carbolic acid is not at all difficult to disguise. An aromatic or perfumed carbolic acid is prepared by the admixture of oil of lavender, etc., which diffuses an agreeable odor of incense, but leaves the virtues of the acid unimpaired.

Eating Without Appetite.

It is wrong to eat without appetite, for it shows there is no gastric juice in the stomach, and that nature does not need food, and there not being any fluid to receive and act upon it, it would remain there to putrefy—the very thought of which should be sufficient to deter any man from eating without an appetite, for the remainder of his life. If a tonic is taken to whet

the appetite, it is a mistaken course; for its only result is to cause one to eat more, when already an amount has been eaten beyond what the gastric juice supplied has been able to prepare. The object to be obtained is a larger supply of gastric juice, not of a larger supply of food; and what ever fails to accomplish that essential object fails to have any efficiency toward the cure of dyspeptic disease; and as the fermentation of gastric juice is directly proportioned to the wear and waste of the system, which it is to be the means of supplying, and this wear and waste can only take place as the result of exercise, the point is reached again that the efficient remedy for dyspepsia is work—out door work—beneficial and successful in direct proportion as it is agreeable, interesting and profitable.

Comfort For Tea Drinkers.

In the life of most persons a period arrives when the stomach no longer digests enough of the ordinary elements of food to make up for the natural daily waste of bodily substances. The size and weight of the body, therefore, begins to diminish more or less perceptibly. At this time tea comes in as a medicine to arrest the waste, to keep the body from falling away too fast, and thus to enable the energetic powers of digestion still to supply as much as is needed to repair the wear and tear of the solid tissues. No wonder, therefore, that tea should be a favorite, on the one hand with the poor, whose supply of substantial food is scanty, and on the other with the aged and infirm, especially of the feeble sex, whose powers of digestion and whose bodily substances have together begun to fail. Nor is it surprising that the aged female, who has barely enough of weekly income to buy what are called the common necessities of life, should yet spend a portion for her ounce of tea. She can live as well on less common food, when she takes her tea along with it; she feels lighter, at the same time more cheerful and fitter for her work, because of the indulgence.

Influence of Climate on Man.

It is not generally known, but it is nevertheless true, that a pure, moderately dry air generally produces great mental brightness, especially with full blooded persons. A cloudy and moist atmosphere, on the other hand produces mental relaxation, and with many, melancholy. This explains why suicides so often happen when the sky is overcast. The depressed mental state is thus further enhanced. Villeneuve reports that of every ten suicides which were committed in Paris during two years, nine took place in the rainy season. The influence of the climate is also well exemplified in the case of mountaineers. They are quicker more active and excitable. The Swiss naturalist, Desor, in a recent essay, describes the climate of North America as very changeable and dry. After having explained a number of phenomena produced by the climate in general, depicts its influence upon the inhabitant of this country. He derives from the climate his activity, acuteness, his tall stature, his eagerness for gain, his practical talent, and his love of adventure. It is also well known that the inhabitants under a preponderating clear sky possess more talent for art, while those under a gloomy sky have more propensity for speculation and thought.

TAKE CARE OF THE EYES.—Looking into a bright fire, especially a coal fire, is very injurious to the eyes. Looking at molten iron will soon destroy the sight. Reading in the twilight is injurious to the eyes, as they are obliged to make great exertion. Reading or sewing with a side light injures the eyes, as both eyes should be exposed to an equal degree of light. The reason is, the sympathy between the eyes is so great, that if the pupil of one is dilated by being kept partially in the shade, the one that is most exposed cannot contract itself sufficiently for protection, and will ultimately be injured. Those who wish to preserve their sight, should preserve their general health by correct habits, and give their eyes just work enough, with a due degree of light.

LEIBIG ON APPLES.—Dr Leibig says on apples: "The importance of apples as food has not hitherto been sufficiently estimated and understood. Besides contributing a large proportion of engar, mucilage and other nutritive compounds in the form of food, they contain such a fine combination of vegetable acids, extractive substances and aromatic principle as to act powerfully in the capacity of refrigerents, tonics and antiseptics; and when freely used at the season of ripeness by rural laborers and others they probably maintain and strengthen the power of productive labor."

ROLLER SKATES. C. H. W. Columbia.—For the right to use the Boone patent C-spring skate, apply to Underhill Boynton, General Agent, at No. 105 Montgomery street, San Francisco, who will also receive orders for skates.

THE SAN JOAQUIN IRRIGATION SCHEME. The gentlemen who have projected this important enterprise are evidently in earnest, and have already placed three surveying parties in the field. Two of them have started from Millerton on the San Joaquin river. One will run a line north and the other south from that point. The other party starts from Kern river and will survey the line along the base of the Coast Range on the west border of the valley.

The projectors express confidence that the crop of 1873, in the San Joaquin Valley, will be raised by aid of these improvements, and that thereafter the people of that now parched region will be in a position to laugh at drouth, and become the most successful and independent farmers in the state.

SMELTING WORKS IN COLORADO.—The Colorado Miner notices a project for erecting smelting works, somewhere near Golden (we presume). It justly advises the parties to invest a sufficiently large capital and not to put in dribbles.

THE DIAMOND FIELDS of South Africa, according to the latest accounts, are yielding largely. Diamonds are reported as having been found in large numbers and of great value,—from \$50,000 downwards. Disputes as to ownership of lands are also reported as frequent.

A USEFUL DEVICE, according to the Valjejo Chronicle, has been put in operation in some parts of Solano where the grain and grass are very short. An apron is fitted under the sickle of the mower which catches all the grass, and when full is dumped into piles. Grass and grain not over three inches in height are thus secured, in some cases at the rate of a ton to an acre. This device might probably be found useful in other parts of the State, where the drouth has stunted grain and grass.

A New Road Steamer.

That we have not made more extended mention of the road steamer which has been in the course of construction in this city, is due simply to the fact that we wished to have some tangible evidence of its powers and to be satisfied from personal observation as to its capabilities. Having now had this evidence, and being satisfied that it can do what we were told it was capable of, from seeing it at work, we are better prepared to speak of its merits.

The "American Overland Steamer," as it is called, is the invention of Oliver Hyde & Son, of this city. The machine was built at the Ætna Foundry, and has been tested a couple of times,—the last time on the 20th inst., when it acted in the most satisfactory manner. It is in many respects similar to the Thompson steamer, yet differs therefrom in several important points, in which it appears to be an improvement on its predecessor.

The steamer weighs 20,500 pounds. The boiler is four feet in diameter and six feet high, with 180 tubes, furnishing steam for two engines, with link motion and variable cut-off, running about 200 revolutions per minute, reduced by the gear 16 times, and giving the steamer a speed of some three miles per hour. It has a very neat donkey steam pump, invented by Mr. W. W. Hanscom of the Ætna Foundry, which is so arranged that it can be used for filling the tanks from wells, springs or creeks. The steering apparatus is simple and effective, a hand wheel operating on a segment of a screw gear, on the top of the pintel of the guiding wheel.

The most noticeable improvement is in the construction of the rubber tires of the wheels. In place of the rubber band of the Thompson steamer, there is a series of rubber rolls placed side by side across the face of the wheel. The triangular spaces between the inner parts of these rolls are filled with iron wedges, bolted to the metallic rim, and the corresponding spaces between the outer parts are filled by similar wedges, each one bolted to an iron bar somewhat similar to the protecting bars on the Thompson steamer.

The construction and fastening of these bars form another important point. They are bent parallel to the sides of the wheel, so as to enclose the tire on three sides, and thence, near the ends, bent again at right angles, forming a sort of lug which can play freely on the inside of a metal ring, of somewhat less than the diameter of the wheel, which is firmly fastened to the wheel, one on each side. Thus each bar is entirely independent of any other. In the Thompson steamer these bars are connected by links, and these links are in practice severely strained, the pull coming upon them. In the Hyde steamer, the whole pull is taken up by the rubber rolls and intervening angle-pieces, that is, by the parts expressly intended to bear the strain. By the use of the single rubber rolls, in case of injury to one part, only that part or roll is damaged and can be easily replaced. Moreover, they can be made of cheaper rubber than the single band and can be prepared, it is said, at a much less cost relatively. It is found in practice that they yield sufficiently to relieve the wheel, and, indeed, that they revolve slightly at each contact with the ground, on their own axes, thus wearing equally on all sides.

This construction, again, gives a grip on the ground somewhat like that, as has been remarked, of an elephant's foot. The tires yield sufficiently under the pressure to give a traction tread of 15 inches square on the ground under each wheel, equal to a pulling power of about 4,000 lbs. If we take the power required to draw one ton at the rate of one mile per hour over a level, clean, McAdam road as 68 lbs., this would make the steamer capable of hauling a weight of 60 tons over such a road at the speed mentioned. The power required for the same over a level newly gravelled road being given as 320 lbs., the steamer would pull 12 tons. It is stated that in practice, over a fair road, it will draw with ease 40 tons.

At the trial on the 20th inst., the steamer hauled two large columns (cast for the State Capitol), of a total weight, including trucks, of 26 tons, from the Miners' Foundry to the Central Pacific Railroad station

at the foot of Second street. There are varying grades on the route, some quite steep, and varying character of ground, but the machine traveled on steadily and easily with its heavy load, turning the corners nicely and otherwise acting to the satisfaction of the observers and managers. A severer test will hardly ever be met with in practice than that over the loose cobble stones and the railroad track on the steep grade of First street.

The steamer in question is intended for work in Utah. Another will be built for the competitive trial at the coming State Fair at Sacramento. It will be a matter of sincere congratulation for our coast, if California can, as now appears to be the case, invent and build a practical traction engine for hauling freight, for deep plowing, and for other agricultural and general purposes.

In our remarks, we cannot in fairness omit giving credit to Mr. W. W. Hanscom and Brothers, of the Ætna Foundry, for their assistance in constructing the steamer. Their mechanical skill and talent, and the energy and interest with which they have worked on the machine, have proved most valuable aids in rendering certain its success.

The New Pacific Railroad.

The extension of the Union Pacific Railroad westward is an old project, which has, however, had no prospect previously of becoming a speedy fact. The (comparatively) recent change of management of the California Pacific, and the acquisition of the other approaches to this city by the Central Pacific, have apparently led to the earlier undertaking of an enterprise of the greatest importance to the coast.

The route of the new line, as given, is about as follows: From the northern end of Salt Lake to the Snake River, Idaho; along this river, some 300 miles, to its bond to the north near the boundary of Oregon and Idaho; thence, some 300 miles, to Christmas lakes, north of the north-east corner of California; thence one branch north-west to connect with roads in Oregon, and another south to join the California Pacific. Whether this last will run to the east, or cross immediately and run along the west, of the Sierra Nevada, is not agreed on by journalists, who otherwise coincide as to the route here given.

The building of this road will lead to the extension of the Central Pacific eastward. It must have some effect on, or be affected by, the North Pacific, as well. In fact, the project has the most important bearing not only on our State, but also on Idaho, Montana and Oregon. But we must remember that there is no real certainty as yet concerning the road or concerning the route. That it will be of the greatest advantage to the coast, if built, is certain; but that it will be equally advantageous, with competing routes on each side, to the builders, is not so certain; and this renders us doubtful until we see work actually commenced.

Since the above was written, we see that the articles of incorporation of the California Railroad Eastern Extension Company have been filed in the office of the Secretary of State. The capital stock of the company is fixed at \$50,000,000, and the incorporators are Milton S. Latham, I. Friedlander, W. H. Tillinghast, W. F. Roelofson, Col. J. P. Jackson, Rudolph Sulzbach (of Frankfort on the Main), Gen. John B. Frisbie (of Valjejo), A. Gansl (representing the Rothschilds), E. H. Green (of London), Eugene L. Sullivan, Julius May (of Frankfort on the Main), A. de Laski, (of London), Faxon D. Atherton, and Richard P. Hammond. The Trustees, on Tuesday, met in this city and elected Wm. F. Roelofson, President, J. P. Jackson, Vice-President, M. S. Latham, Treasurer, and W. H. L. Barnes, Secretary. The Bulletin says: We have the most positive assurance that the entire capital stock of the company has been subscribed, and work will be commenced within a short time on the extension from Davisville northward, and the surveying of the balance of line will be pushed vigorously, preparatory to commencing the construction of the road at various points. The company are of the opinion that the road can be constructed and put in working order to Ogden within two years from this date.

THE Eureka (Nev.) Sentinel changes from a weekly to a daily paper. This is pleasantly indicative of the prospects of Eureka.

A New Palace Car.

The elegant drawing-room car, just completed by the Kimball Carriage and Car Manufacturing Company, has been thrown open to public inspection during the past week, and has been visited by many. As a sample of workmanship, it is certainly of the very highest order, and as a specimen of California manufacture and of Pacific coast material, it is exceedingly interesting.

The car body is 60x10¼ feet. The exterior is very elegant, with highly polished prima vera wood panels and blue-and-gold borders. On each side is an oval medallion, bearing the title of the car "Siempre Viva," surmounting the arms of California. At the corners and elsewhere are fine little landscape views of the Yosemite, the Big Trees, etc.

There are six sections or compartments, entirely distinct from one another, placed alternately first on one side and then on the other side of the car, and separated from one another by the common passage way which consequently has a zigzag path around three sides of each section. There is also a passage way through each section which can be closed by the party having the compartment when they desire. This arrangement enables a party to seclude themselves from others, or to mingle with their fellow-passengers, as far as they may elect. Each section has single and double berths, water-closet, wash basin, and complete toilet arrangements, with lamps, tables, closets of perfumed wood, crimson and green velvet lounges, etc., etc.

The finish of the interior is magnificent. The elegant, but most tasteful paneling is made up of thirty different kinds of wood, including California laurel, Mexican rose, coa wood, maplo, coral wood, etc. These are alternated with the best of taste. The ceilings are frescoed and the windows are of cut glass, where such material is admissible. The cars are warmed by Baker's patent heater.

Every modern improvement conducive to comfort and safety is to be found. The trucks are six-wheeled, with the American Elastic Wheel, and with Jeinsen's patent lubricators for the journal boxes. Miller's patent trussed platforms, compression buffers and automatic couplers are also employed, with other devices of the most approved construction.

We doubt whether a car has ever been made before, which can compare with this for really regal magnificence, joined with the most exquisite of taste. We are told that Mr. Atkinson has had the general superintendence of the construction, and has made all the drawings and designs. We are perfectly satisfied to have the car go East as a sample of what can be done by a California manufactory.

THE PARTZ SUGAR REFINER is still on trial at the Alvarado sugarie. The objects of this improvement are to cast the sugar loaf in a single cylinder containing one or more tons, instead of the multitude of small molds at present used—thus saving great space and much manipulation; also, by the use of steam outwardly and hot air forced through the mass, the crystallization is effected more quickly and more perfectly, and with a much less use of white liquor.

Two trials have been made, to test the best consistency in the boiling for this new process, and the proper force and temperature of the hot air injection. It is found that the air freely penetrates the semi-liquid mass and effects the drying, while the syrup discharges freely. A third filling was made on Tuesday last, the sugar having been boiled to a consistency supposed to be better adapted to this process. Great hopes are entertained of final success; a result which will revolutionize an important step in the present costly way of refining raw sugars. The trials are made with raw cane sugars from Peru, the beet sugar of the company's make having been previously sold in market.

The Crown of New England.

We gave, some time ago, an illustration of one of the glories of the Pacific Coast,—of the Yosemite Valley. To-day we give an engraving of a scene of grandeur of the Atlantic Coast. Both of these are from chromos of Prang. The engraving to-day, however, hardly does justice to the original which was shown us by Messrs. Snow & Roos, at their art gallery, 21 Kearny street. The green of the foliage, the azure of the mists, the glowing and fading colors of clouds and distant hills, cannot of course be depicted in the engraving. Still a very fair idea is given of the grandeur of Mt. Washington and its brother hills.

The chromo in question is after an exquisite painting by Geo. E. Brown. To give an adequate description of the work, or of the scene it represents, demands an abler pen than ours. We prefer, therefore, to recall the words of one whose name is dear to our coast,—who has written of our mountains and hills as he has written of those of New England. Thomas Starr King thus speaks of one point of view of the White Mountains of New Hampshire:

Such is the invitation with which North Conway coaxes us from the gaunt and grizzly peak which peers over one of its south-westerly walls. It is a short task to give the topographical dimensions and to describe the mountain framing of this village. We can say easily that it is a level bank about thirty feet above the channel and the meadows of the Saco River, extending some four or five miles, and measuring, perhaps, three miles in breadth. On the west, the long and noble Mote Mountain guards it; on the east, the rough, less lofty, and bending Rattlesnake ridge helps to wall it in, unattractive enough in the ordinary daylight, but a great favorite of the setting sun which loves to glorify it with Tyrian drapery. On the south-west, Chocoma manages to get a peep of one corner of its lovely meadows. Almost the whole line of the White Mountains proper, crowned in the center by the dome of Mt. Washington, closes the view on the north-west and north. And nearer on the north-east, swells the symmetrical Kearsarge, the queenly mountain of New Hampshire, which, when the Indian titles were expurged from the great range, should have been christened "Martha Washington." And far to the south, the hills "soften away in a series of smaller and smaller darkening mounds or humps, that answer to the description of the sea-serpent's back."

But what suggestion of the exquisite loveliness of the village is given by the most accurate report of its meadow farms and mountain guards? We well remember driving into it, some three years since, about sunset, under waving hangings of vermillion and gold. The sinking sunlight was shedding yellow splendor over the meadows, tinging the higher edges of the azure mists that settle in the ravines of Mt. Washington with tender rose-color, and flooding the upper half of the Rattlesnake ridge with purple, sharply ruled from a basis of deep bronze green. * *

One of the prominent pleasures of a cool day is to find different points for studying Mt. Washington. In what novelties of shapes, dignity and effect he may be thrown by the rambles of a morning!

We may see his steep, torn walls rising far off beyond a hill which we are ascending, and which hides from us most of the foreground in the village and the base on which the mountain stands; or may catch a glimpse of him through a couple of trees that stand sentinel to keep other mountains of the range from an intrusion that will reduce his majesty; or may seek a position in a grove whose breezy plumes afford the cheerful contrast of motion and color to set off his gray grandeur and majestic rest; or from different points near the Saco may relate him, by changing angles, into fresh combination with the level verdure of the meadows, or with some curve of its brooks or some graceful thicket of its maples.

BORING FOR WATER WEST OF THE COMSTOCK.—The continued failure of the supply of water in this section, says the *Gold Hill News* of May 11th, induced partly by the recent dry seasons, as well as by reason of the drainage caused by the sinking of deep shafts in the mines along the Comstock, directs the attention of practical men to the development of new and much-needed resources in that respect. Already the lack of water is severely felt in the milling and tailings-saving operations in

Great Coal Discovery at Elko.

Prospecting for coal has been going on with more or less success by several determined men since the 12th of January, 1869, in and about the low range of neighboring hills to the south-east of this town. The first discovery of the probable existence of coal was made by R. D. and John A. Norton, in company with Charles A. Brossman, about the time above indicated. These gentlemen, from the first discovery of croppings, worked energetically until about one year ago, when the Central Pacific Railroad Company took hold of the work of prospecting and pushed it forward for some two or three months without developing anything of a very substantial character. The first-named parties then again gave it another trial, and continued to work up to about the 1st of November, 1870, with varied success. During their entire operations, they sank or excavated three shafts upon the coal field at different points, varying in depth from 100 to 130 feet; they also run two incline shafts, or tunnels, one of which reached the distance of 125 feet in depth, following a vein of 2½ to 3 inches thick of a fair quality of coal.

About the middle of November, 1870,

Reducing Chloride of Silver.

[Continued from page 313.]

The projecting horizontal strips of silver jammed into the sides of the lower frame are then connected with the ends of the silver forming the loops in which the argentic chloride is suspended, and the whole apparatus thus charged is placed in a tub filled with water. After a short time galvanic action is discernible; the liquid gets gradually warmer, and a strong galvanic current is observed. After about twenty-four hours, the action has nearly ceased, and the whole argentic chloride is found to be completely reduced to metallic silver which retains in the silver loops the same shape, and, outwardly, also nearly the same appearance as when first introduced as argentic chloride. The latter contains always more or less chloride of copper, eliminated together with the silver during the operation of refining by chlorine, which is reduced together with the chloride of silver; in fact, this soluble chloride of copper helps to act as an exciting liquor for the battery. In the first experiments, a weak solution of salt (chloride of sodium) was used as an exciting liquor; but it was found that this could be dispensed with, and only common water used. The action, however, is in this case a little retarded, and does not become powerful until about two hours after the battery is set. By using a part of the resulting liquor from a previous reduction of argentic chloride, and which contains chloride of zinc, it has been found that the galvanic action sets in very rapidly, and accelerates thereby the completion of the reduction.

No acid is used, and therefore the amount of zinc used in each reduction has invariably been found to be almost the theoretical quantity to combine the chlorine of the argentic chloride treated with the metallic zinc, in order to form chloride of zinc.

The quantity of metallic zinc thus used was always from 24 to 25 per cent. of the argentic chloride reduced.

The reduced silver is boiled out in acidulated water, in order to remove the basic and oxy-chlorides, and finally in pure water, while still suspended in the silver loops. As soon as it is taken off the last boiling, it is immediately ready for the melting pot, since the heat from the boiling water dries the porous mass sufficiently to allow of its immediate melting. The seven zinc plates, when first used, weigh about 140 lbs. avoirdupois; the six slabs of argentic chloride, of the dimensions already given, weigh about 1,400 ozs. troy.

The zinc plates are used over again, until too thin for that purpose, when they are remelted, and cast into new plates. It has been found that the quantity of zinc used is little, if at all, increased by prolonging the time of connection with the silver plates after the reduction is completed; the whole apparatus, when once set in operation, can therefore be left to itself until it is found convenient to melt the reduced silver.

While this apparatus reduces the argentic chloride much quicker than if the latter is simply placed in contact with zinc or iron plates, it obviates any handling of the argentic chloride from the time the latter has been placed in the silver loops until the reduced silver is ready for the melting pot—advantages which have been fully appreciated by those who formerly had to resort to tedious and disagreeable manipulations.

THE FIRST SPIKE of the Pacific division, North Pacific R. R., was driven May 16th.

THE CROWN OF NEW ENGLAND—AFTER G. E. BROWN.

the cañons near here, and if a better supply could be procured at reasonable cost, an important object would be attained. All the deep shafts are sunk at the east side of the Comstock, certainly developing much water in that direction, but not enough, and it is also found now that at the lowest levels the water supply gives out, in some instances, altogether. The question now is whether the requisite supply of water could be found west of the ledge. It is well known that the rock on that side is extremely hard, and although drifts have been driven into it from the mines at various points and depths, all encountering more or less water, yet none have penetrated far enough to demonstrate how much water could be looked for in that direction. Certain parties are now agitating the idea of boring artesian wells west of the ledge, and it is very possible that in crossing the strata, all of which apparently dip east at an angle of forty-five degrees, like the Comstock, they might cut some heavy vein of water, or several veins, which would give a flowing well, or at least one which could not be pumped dry, therefore furnishing a good supply of that much-needed article. The many springs in the ravines west of the Comstock, even away up towards the summit of Mount Davidson, the head of Crown Point ravine, and even Washoe Lake, support the idea of there being a plentiful supply of water to be found by boring through the various strata west of the old Comstock somewhere. We would like to see the idea practically acted upon and demonstrated.

A WONDERFUL cave is reported discovered in the neighborhood of Owyhee, Idaho.

The Central Pacific Railroad Company again took hold of the matter in good earnest, through their Superintendent and coal expert, Mr. Tompkins, who continued the work of prospecting with unabated energy. The point selected by Mr. Tompkins, for the purpose of prospecting, is about three-fourths of a mile to the south-east of Elko, where he erected a boring apparatus and commenced operations. At the depth of 90 feet from the surface, the first vein of coal was penetrated, which was some 2½ feet in thickness. The work was still continued, and upon reaching the depth of 130 feet, another vein of coal of fair quality, of 3½ feet in thickness, was developed. Notwithstanding these discoveries, the boring was continued, under the firm belief that a still larger vein and a better quality of coal would ultimately be found. Such has proven to be a fact by the discovery and development, at the depth of 350 feet, of a splendid vein, 4½ feet in thickness, of the best quality of coal which has been opened out to them.

The specimens shown us by the Superintendent are superior to the best Rocky Mountain coal. Many coal mining experts who have examined the specimens, declare that the coal in question strongly resembles the Cumberland coal, and, in their opinion, is equally as good. The vein runs southwest to northeast, with a dip or incline to the northwest. Mr. Tompkins went below yesterday to report to the company his success. Upon his return it is anticipated that a large force will be put upon the mine. Beyond all question, this development will add much to the wealth and permanent prosperity of this town.—*Elko (Nevada) Independent*, May 13.

DOMESTIC ECONOMY.

Chemistry of the Kitchen.

Although it is generally admitted that a thorough knowledge of chemical science would be of value in the kitchen, we do not deem it necessary or desirable that those employed in or directing the labor of the kitchen should be chemical experts, yet a knowledge of the broad principles upon which the more ordinary operations depend, will result in a great improvement in the character of cooking in general, and a great saving in the quality and quantity of provisions and fuel.

We do not propose to enter into any speculative views or improvements, but confine our remarks to principles well established, and universally admitted among all theoretical and practical chemists, although such principles may appear contrary to the preconceived notions of some of our readers.

The subject will be discussed under the heads of Boiling, Roasting, Baking, Stewing and Frying.

Boiling.—When a liquid is placed over the fire to boil, the vessel becomes heated, and the particles of the liquid in contact with the heated portion of the vessel also become heated, and rise to the surface, on account of being expanded; by this operation fresh particles of the liquid are constantly being brought into contact with the heated vessel; this action continues, so that the liquid becomes heated throughout. Therefore if the heat be applied at the upper surface of the liquid, it will not be heated throughout, as liquids are bad conductors of heat. This can be clearly demonstrated by taking a champagne or other long necked bottle filled with cold water to within about an inch of the top, then hold the bottle in a slanting position, with the neck over and between three and four inches above the flame of an ordinary gas burner or lamp; in a few moments small bubbles will be seen to form in and escape from the water; these are due to the air being expelled from the water. After eight to twelve minutes, the water in the upper portion of the bottle neck will commence to boil violently, and by sliding one hand along up the bottle at about three inches below its mouth will be felt the first indications of the increase of temperature, which indication very rapidly increases as the hand is moved toward the mouth of the bottle; and so great is this increase of temperature that the hand cannot be held to the bottle neck much over an inch above the first mentioned point. Now if the bottle be set upon the table, the above experiments of the hand can be repeated after a quarter of an hour, showing that the heat has not traveled downward by conduction. If, in the commencement of the experiment, ice water be placed in the bottle, a lump of ice can be put in the bottle, having in the first place attached to it a stone, so as to sink it to the bottom; then proceed with the experiment as above set forth; you will then have ice and boiling water in the same bottle. This instructive experiment can be modified by putting the ice and stone into the bottle, then filling it about half full of ice water, after which hold the bottle at an inclination, and fill up by pouring into it, gently, boiling water, allowing the water to run down the side of the bottle; upon placing the bottle upright on the table, it will be found to be cold at the bottom and hot at the top; but if the bottle be now corked and inverted, the cold water will attempt to descend, and the hot water, which has become the lower stratum, attempts to rise; thus the two layers become commingled, and the whole mass reaches a uniform temperature. In making this last experiment it is advisable to do it over a large pan, as the bottle may break when the hot water is being poured into it.

We now return to the liquid over the fire, which, having arrived at the boiling point, no amount of fire can make it any hotter. This can be shown by placing a thermometer in the boiling water, then augmenting the fire; the thermometer will not rise, although the ebullition is very much increased. This is explained by the fact that after water arrives at the boiling tem-

perature, it absorbs an additional large amount of heat to convert the water into steam, which is no hotter than the boiling water; therefore, when the fire is augmented, the only effect is to form an increase of steam in order to carry off the increased amount of heat. The practical lessons to be learned from these facts are—

1st. Violent boiling does not increase the heat of the liquid, consequently does not cook articles therein more rapidly.

2d. There is a useless consumption of fuel which goes to the generation of steam, which is thrown out into the kitchen, making the air damp and hot, and charged with organic matter.

3d. Steam has the property of carrying off with it the aroma and flavor of vegetable substances, and meats, as shown in the manufacture of attar of roses, oil of peppermint, etc., etc., and therefore the excessive escape of steam incidental to violent boiling deteriorates the quality of the article being cooked.

4th. The violent ebullition throws the articles together, thus bruising them; and in the case of green corn, etc., results in the escape of valuable portions of the food into the boiling liquid.

In our next article we will show the application of the foregoing principles (in connection with others) to the preparation of soups, broths, etc., etc.—*Industrial Press.*

A NEW KIND OF WINE.—Dr. Thudichum,

in his lecture on wines at the Society of Arts, introduced a new wine which had been made from tea. He stated that the wine was a good stomachic, and would probably be useful both in ordinary diet and as a medicinal remedy.

Household Sins.

Some cooks will throw out the water in which meats have been boiled, without letting it cool to take off the fat.

Bits of meat are thrown out which would make hashed meat.

The flour is sifted in a wasteful manner, and the bread pan left sticking to it. Pie crust is laid by to sour instead of making a few tarts for tea.

Cold puddings are considered good for nothing, when often times they can be steamed for the next day.

Dish cloths are thrown down where mice can destroy them.

Vegetables are thrown away that would warm nicely for breakfast.

The scrubbing brush is left in the water. Tubs and barrels are left in the sun to dry and fall apart.

Nice handled knives are thrown into hot water.

Silver spoons are used to scrape kettles. Cream is allowed to mould and spoil.

Coffee, tea and spices are left to stand open and lose their strength.

The cork is left out of the molasses jug, and the flies take possession.

Vinegar is drawn into a tin basin and left to stand until both basin and vinegar are spoiled.

Dried fruit is not taken care of in season and becomes wormy.

Potatoes in the cellar grow, and the sprouts are not removed until they become useless.

Pork spoils for want of salt, and beef because the brine wants scalding.

Bones are burned that would make soap.

Clothes are left out on the line to whip to pieces in the wind.

Brooms are never hung up and soon are spoiled.

WASHING TABLE LINEN.—It is poor economy to boil table cloths if brown. It gives them an old, yellow look. White ones may be kept clear by spreading for a few hours in the hot sun. If there are fruit stains on them pour boiling water over them before washing.

Domestic Receipts.

RHUBARB VINEGAR.—It is said that a very excellent vinegar may be made from the rhubarb plant in the following manner: For five gallons take 12 ordinary sized stalks of rhubarb; pound or crush them with a piece of wood in the bottom of a strong tub; add 3 gallons of water; let this stand 24 hours; strain off the crushed rhubarb and add 9 pounds of sugar free from molasses, and a small teacupful of the best brewer's yeast; raise the temperature to 65° or 68°, and put into a 12-gallon cask; place it in a position where the temperature will not fall below 60°. In a month strain off from the grounds, returning it to the cask again, and let it stand till it becomes vinegar.

TO MAKE CLOTHING WATER-PROOF.—Dissolve half a pound of sugar of lead in a bucket of soft water; add half a pound of alum and stir till clear. Put the garment to soak in the liquid for 24 hours; then take out and hang up to dry, without wringing. This mode of rendering cloth water-proof is capable of a very wide and useful application. It is applicable to all kinds of cotton goods. Overalls, tents, etc., may, by its use, be made to shed water like a duck's back. The preparation is very simple and cheap, and to persons who affect boating, fishing, or yachting, where they expect to be exposed to the weather for several days, it will prove a valuable receipt.

A SUBSTITUTE FOR MILK OR CREAM.—Beat up the whole of a fresh egg in a basin, and then pour boiling tea over it gradually, to prevent its curdling. It is difficult from the taste to distinguish the composition from rich cream.

Mechanical Hints.

TO PRODUCE UPON IRON A DURABLE BLACK SHINING VARNISH.—Take oil of turpentine, add to it, drop by drop, and while stirring, strong sulphuric acid, until a syrupy precipitate is formed, and no more of it is produced on further addition of a drop of acid. The liquid is now repeatedly washed with water, every time refreshed after a good stirring, until the water does not exhibit any more acid reaction on being tested with blue litmus paper. The precipitate is next placed upon a cloth filter, and after all the water has run off, the syrupy mass is fit for use. It is painted over the iron with a brush; if it happens to be too stiff, it is previously diluted with some oil of turpentine. Immediately after the iron has been so painted, the paint is burnt in by a gentle heat, and, after cooling, the black surface is rubbed over with a piece of woolen stuff dipped in, and moistened with linseed oil. It is said this varnish is not a simple covering of the surface, but that it chemically combines with the metal, and does not, therefore, wear off or peel off, as other paints and varnishes do, from iron.

PAINTING ZINC.—A difficulty is often experienced in causing oil-colors to adhere to sheet zinc. Roettger recommends the employment of the following composition: One part of chloride of copper, one of nitrate of copper, and one of sal-ammoniac are to be dissolved in sixty-four parts of water, to which solution is to be added one part of commercial hydrochloric acid. The sheets of zinc are to be brushed over with this liquid, which gives them a deep black color; in the course of from twelve to twenty-four hours they become dry, and to their now dirty gray surface a coat of any oil-color will firmly adhere. Some sheets of zinc prepared in this way, and afterwards painted, have been found to entirely withstand all the atmospheric changes of winter and summer.

TO BLACKEN ZINC.—Zinc may be given a fine black color, according to Knapp, by cleaning its surface with sand and sulphuric acid, and immersing for an instant in a solution composed of four parts of sulphate of nickel and ammonia in forty of water, acidulated with one part of sulphuric acid, washing and drying it. The black coating adheres firmly, and takes a bronze color under the harnisher. Brass may be stained black with a liquid containing two parts arsenious acid, four hydrochloric acid, and one of sulphuric acid in eighty parts of water.

CEMENT FOR SEALING EDGES OF THIN GLASS.—Hunt's formula for a cement, which is used for sealing the edges of thin glass is to evaporate Canada balsam to a solid consistence, dissolve it in an equal bulk of benzole and then thicken it to about the density of cream with white lead or zinc ground in oil.

LIFE THOUGHTS.

EXPECT nothing from him who promises a great deal.

PEOPLE obey willingly when they are commanded kindly.

HOLD your little twinkling light holdly and honestly; then God will pour in the oil and make it a blazing torch.

THE vain man idolizes his own person, and here he is wrong; but he cannot bear his own company, and here he is right.

FROM the small hollow of the dice-box arise fear, rage, convulsions, tears, oaths, blasphemies—as many evils as ever flew from the box of Pandora.

After All.

It would be a sad thing, to unbelieving ones, if it should transpire that they are mistaken, after all—in the end they should face death with the painful consciousness of something more than they have counted on beyond. And unless your faith in unbelief is stronger than that of many another, this may happen. The chances are very great indeed, that happen it will any way.

Unbelief is rarely stronger than belief—never so strong when strength is most needed. Unbelief may be in the estimation of certain philosophers, more philosophical than belief, but thousands can testify, have testified, that it is not half so comforting. Philosophy is good, but at certain times comfort is better, and it is always more sweet. Philosophy may help a man to die like a stoic; but belief makes it his glorious privilege to put aside his earthlyness like a saint.

Then what does one lose, by believing? Nothing, surely. But what may he not lose, clinging ever to his doubt? It is this possibility of loss that ought to be more carefully considered. Did possible loss attach to both sides of the question of accepting Christ, the skeptic would seem reasonable in skepticism. But such is not the fact. Accepting Him as the Savior of the race entails no loss whatever, unless to give up some injurious pleasures count as losing; whereas positively rejecting Him may result in the greatest loss possible to any.

After all your want of faith, there may come an eternity of regrets. After all your unbelieving smiles at the foolish faith of some whom you now choose to denominate simple-minded, you may come to see that in all their foolishness and simple-mindedness there was the truest wisdom. Others have known a like experience. Are you wiser than they who have gone before?

A BEAUTIFUL THOUGHT.—God knows what keys in the human soul to touch, in order to draw out its sweeter and most perfect harmonies. They may be the minor strains of sadness and sorrow; they may be the loftier notes of joy and gladness. God knows where the melodies of our nature are, and what discipline will bring them forth. Some with plaintive tongue must walk in lowly vales of weary way; others in loftier hymns of nothing but joy, as they tread the mountain tops of life; but they all unite without discord or jar as the ascending anthem of loving and believing hearts finds its way into the chorus of the redeemed in heaven.

PROFUNDITY OF THOUGHT is generally purchased at the expense of versatility. To be very profound it is necessary that the intellectual eye be fixed for a long time on one continued series of operations; to be versatile the mind must glance from subject to subject, and brood over none. Profundity plunges to the depth, while versatility skims the surface of the sea of speculation; while the former is going down, the latter is sporting onward on easy wing.

TO JUDGE OF CHARACTER.—We may judge a man's character by what he loves—what pleases him. If a person manifests delight in low sordid objects, the vulgar song and debasing language; in the misfortunes of his fellows or animals, we may at once determine the complexion of his character. On the contrary, if he love purity, truth, modesty—if virtuous pursuits engage his heart, and draw out his affections—we are satisfied that he is an upright man. When we see a young man fond of fine clothes, and making a fop of himself, it is a sure sign that he thinks the world consists of outside show and ostentation and he is certain to make an unstable man, without true affection or friendship, fond of change and excitement, and wearying of those objects and pursuits which for a time give him pleasure.

Business Cards.

A NEW PATENT.

If you want a superior set of Teeth on Gold, Rose-Pearl, or Pyroxaline, that will not loosen while masticating, call on DR. BEERS, 109 Montgomery street, opposite the Occidental.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third season. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier.
You cannot take hold of it too confidently, and you can warrant your customers that it is Unequaled.

For Whiteness and Brilliance of Flame,
Economy in the use of Oil,
Freedom from Smoke or Smell,
Reliability in Wind and Motion,
Coolness of Burner and Oil Cup, and
Impossibility of Heating or Explosion,

For the Variety of Places and Purposes to which it is adapted, the Readiness with which it Sells, and the
Complete Satisfaction it Gives
to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render all other Kerosene Lanterns so Disagreeable, Unreliable, Wasteful and Dangerous.

Please favor us with your orders PROMPTLY, and oblige

Machine for Screwed Boots and Shoes.

We have been shown what appears to be a very useful device for the manufacture of screwed boots and shoes. The accompanying cut has been furnished us, which, although only a rough sketch, may yet aid in understanding the description.

The device is a double apparatus which forms and puts in two screws at a time.

The proper wire is placed on the two reels, one coil on each reel, which are shown at the top of the machine, which are so mounted that their frames converge to a point, and which are actuated through gear wheels by a hand wheel. The wire passes from the reels into peculiar dies, whose action, in cutting the screw threads, draws the wire from the reels. After leaving the dies, the screws pass out through openings in the face of a cylindrical device (which holds the dies) into the sole of the boot which is placed on the vertical serrated standard shown in front of the ma-

chine. The wires are here devoted as projecting from the cylinder mentioned. On the face of this cylinder is a rotary cutting plate which is actuated through a series of levers by a treadle, and which cuts off the screw when inserted a proper distance into the hoot.

The device is simple and its advantages will be readily appreciated by those engaged in the manufacture to which it refers. Steps have been taken, through the SCIENTIFIC PRESS Patent Agency, to secure the rights of the inventor, Mr. Andrea Cavalli, of this city. Patent rights may be obtained from Mr. V. Noly, Office *Courrier de San Francisco*, 515 Jackson street, S. F.

Patents to Placer Mining Claims.

In answer to a letter from Hon. A. A. Sargent, the Commissioner of the Land Office has addressed a letter, under date of May 8th, 1871, to the Register and Receiver at Sacramento, in which are instructions of importance to miners.

An application for a patent for a placer mining claim is required by the act to come within the same conditions applicable to claimants of veins or lodes, and the proceedings prior to the survey are the same in both cases; as it is fully set forth in the circular instructions from this office bearing date the 8th of August, 1870.

After the expiration of the ninety days, notice given in such cases, proof of which must be made to the satisfaction of the Register, the placer mining claimant, where the subdivision of a forty-acre tract is necessary, may engage under private contract either a United States deputy, or a county or local surveyor to perform the work at the expense of such placer claimant, such forty-acre tract to be invariably laid off into four lots of equal area; and to suit the circumstances of the case, these lots may be either in the form of squares 10x10 chains or in the form of parallelograms, 5x20 chains; but the lines of these surveys must not be run diagonally to those of the regular surveys, but parallel and at right angles therewith, so as to avoid confusion in the disposal of the remainder of the land.

Such surveys when executed, must be properly sworn to by the surveyor, either before the Register or Receiver, a Notary Public, or an officer of a Court of record, the deponent's character and credibility to be certified by the officer administering the oath.

Upon the filing of the plat and field notes of such survey duly sworn to, you will transmit the same to the Surveyor-General for verification and approval, who, if he

finds the work to have been correctly executed, will give such ten-acre lot, where the same constitutes the entire claim, its appropriate numerical designation in the order of surveyed mineral claims in the township; and in cases where several of these ten-acre lots constitute and are comprised within one claim, they will not receive separate numbers for each lot, but the whole will receive one number in the order of mineral claims in the township.

The Surveyor-General will then mark such claim upon the original township plat on file in his office, and send an authenticated copy of the plat and field notes of the survey to the Register of the proper local land office and to this office as is the case of vein or lode surveys.

Thereafter, if no adverse claim has been presented, an entry will be allowed of such claim at the rate of two dollars and fifty cents for each acre or fractional part of an acre embraced in the survey; the local land officers preserving an unbroken series of numbers for all mineral claims, both lode and placer, and then report the care to this officer in the usual manner, accompanied with a letter of transmission.

It is to be distinctly understood that the foregoing remarks as to survey are intended to apply only to those placer claims which cannot be entered in forty-acre legal subdivisions without interference with the rights of other bona fide mineral or agricultural claimants in the same tract, and you will in all cases require testimony as to whether or not such claimants to such forty-acre tract exist; and where such are found, require the applicant, at his own expense, to cause the survey in ten-acre lots in manner aforesaid, so as to segregate his claim from the remainder; and where there are no such other claimant in the same forty-acre tract, require the entry to conform in its exterior limits to such forty-acre legal subdivisions.

In case there are several placer mining claimants within the same subdivision, they have the option of making joint entry of the land, or of having such smaller subdivisions made and receiving separate patents.

Mineral and Agricultural Lands.

Mr. J. G. McCallum, Register of the U. S. Land Office at Sacramento, has written a letter with regard to disputes of mineral and agricultural land claimants. The letter, dated May 11th, is, in substance, as follows:

In a question between mineral and agricultural claimants as to the character of land applied for by both as between them, the proofs are confined to the land surveyed and applied for as a mining claim, whether a 10-acre tract or less.

Where there is no other survey than the usual one returned by the township plat, the proofs are taken as to the smallest legal subdivision; that is, 40 acres when not fractional. If, for instance, in a 40-acre tract, a 10-acre tract is so valuable for mining as to make the whole 40 acres more valuable for mining than for agriculture, the whole is reserved as mineral; if, however, the 30 acres are so valuable for agriculture as to make the whole more valuable for this than for mining, the whole is awarded agricultural.

It is therefore important to both miner and farmer that the mining claim upon such 40-tract should be surveyed and segregated. The law does not require this of the miner, but by so doing he saves the expense of proving his claim and the costs of litigation. Otherwise it may be merged in the balance of the legal subdivision which may be valuable agricultural land.

If the miner declines to have the survey made, the farmer would have to pay for such survey, unless the Surveyor-General will order it on application. Whether he feels authorized to do this, under the present law, is for the Surveyor-General himself to decide, and to him the matter should be referred.

Co-OPERATIVE MINING.—Agreeable to previous notice, a respectable number of miners assembled, last evening, at 8 o'clock, at Armory Hall, in Treasure City, and were addressed by Dr. McMeans on the subject of Co-Operative Mining. His remarks were well received, and he was requested to visit the Hill again, when, it is contemplated, a large number of miners will be present to consider the subject.—*White Pine News*, May 16.

ORANGES AND GRAPES.—The indications are exceedingly favorable for an unusually large orange and grape crop, the coming season, in the vicinity of Los Angeles,

California and the American Institute Fair.

The following letter, addressed to Mr. S. W. Shaw, of this city, President of the "California Fruit Growers' Association," has been handed us for publication. It fully explains itself, and we trust our fruit growers and others, interested in the productive industries of California, will see to it that the Pacific coast is properly represented at the Exhibition of the American Institute this coming fall. Mr. Shaw authorizes us to state that he proposes to be present at the Fair, and will be most happy to attend, personally, to all California exhibits. We append the letter as follows:

DEAR SIR:—Mr. Lyman, of the N. Y. *Tribune* suggests to me that, as it is desirable that California be properly represented in the fruits as well as other industrial products, at the coming Autumnal Exhibition of National Industries under the management of the American Institute, in New York, you would be one of the best persons to communicate with on the subject. As an old Californian, I am anxious that the land of big beets, big pumpkins, big trees, and big vines—whose fruits are so delicious, whose wines are so good, whose mines teem with as much mineral wealth as does her soil with other virgin products—should let the people of the East perceive with their own eyes some of the big things of which she is capable. They have often read, but do not yet more than half believe the truth, and it will take nothing less than ocular demonstration to fully convince them. If you and other progressive Californians will pitch in and send on such a representation of products as will do honor to the State I will take especial pains to secure for them a place in the exhibition according with their merits, and shall also draw particular attention to them through our metropolitan press, so that all may know where to find and admire them. Our annual attendance at these great exhibitions comprises hundreds of thousands, and I have always thought it a pity that the Pacific slope should fail to reap the manifold advantages which an adequate representation of her industries would secure to her. Respectfully,
GEO. F. DAWSON.
Supt. Am. In. Exhibition.

WHICH WAY DO YOU PIPE?—Under this heading, the *New North West*, of May 5th, gives the following, which is open to further questioning and explanation: Mr. Mat. Wallwork informs us that the Davis Bros., mining on the lower portion of Henderson gulch, have "taken a turn" on mining that is opening the eyes of hydraulic miners. As we understand it, they pipe toward the boxes. This seems the principle of the innovation. It is said to work wonders in chasing dirt and boulders into and through a flume, saving much labor. And now, when you come to think of it, don't it look sensible? The Henderson miners say it is just the thing, and a number are shifting around to work on the same principle. We understand one of the Davis Bros., just over from Idaho, brought the idea with him, and has turned it loose in Henderson. It might do fully as well in other hydraulic camps.

A FAVORABLE NOTORIETY.—The good reputation and extended use of "Brown's Bronchial Troches" for Coughs, Colds and Throat Diseases, has caused the Troches to be extensively imitated. Obtain only the genuine "Brown's Bronchial Troches," and do not be influenced by those who make more profit by selling worthless imitations.

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14y20

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

MULLER supplies the city with opera glasses and spectacles. He is a scientific optician and knows what kind of glasses will best suit the eyes,

Our Printed Mail List.

Subscribers will notice that their names are printed on colored paper and pasted upon each copy of the Press. This is done by machinery, to expedite the issue of our paper, the regular edition of which has become too large to be convenient to send out by the old method of writing the names. The figures found on the right of the pasted slips represent the date to which the subscriber has paid. For instance, 215p70 shows that our patron has paid his subscription up to the 21st of September, 1870; 41y72, that he has paid to the 4th of January, 1872; 410, to the 4th of July, 1870. The inverted letters occasionally used are marks of reference, simply for the convenience of the publishers.

If errors in the names or accounts of subscribers occur at any time an early notice will secure their immediate correction.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Travelling Agents.

W. H. MURRAY—Eastern States.
M. B. STARR—Pacific Coast.
THOS. POYZER—California.

London Agency.—BATES, HENRY & Co., 4 Old Jewry, E. O., & Geo. Street, 30 Cornhill, E. C. London will receive subscriptions and advertisements for the Press.

Thursday Noon our last forms go to press. Communications should be received a week in advance and advertisements as early in the week as possible.

Send us Communications.—They will be re-spectfully. If you have not time or the experience to write finished articles, send us facts brief and plain. We will take care of them. Remember that writers improve themselves with others by use of the pen. Officers of societies, clubs and meetings, please report.

SUBSCRIBERS should send former address, when ordering the paper sent to a new place. Returning a newspaper or blank slip, WITHOUT the name and residence of the subscriber is a thoughtless act, and useless both to subscriber and publisher.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office. apl-hp-tf

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for the preparation of Cocoa, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. Export Chocory Mills, Bruges, Belgium. fe25-ly

YOUNG LADIES' SEMINARY, BENICIA.

The Twentieth Annual Session of this well known institution will commence on the

26th day of July Next.

Previous to that date there will be a complete renovation of the establishment. A fine School Room and many other improvements will be added, and new furniture, carpets, bedding and apparatus supplied.

The course of study and mode of instruction will be such as the best modern culture demands; and in every genuine advantage of school and home, the institution will prove its claim to a place in the first rank.

For particulars address

19v1-lmhp REV. C. H. POPE, Benicia, Cal.

Travelers are always liable to sudden attacks of Dysentery and Cholera Morbus, and these occurring when absent from home, are very unpleasant. The PAIN KILLER may always be carried upon such cases. As soon as you feel the symptoms, take one teaspoonful in a glass of new milk and molasses, and a glass of hot water, stir well together and drink hot. Repeat the dose every hour until relieved. If the pain is severe, bathe the bowels and back with the medicine clear.

In cases of Asthma and Phthisis, take a teaspoonful in a glass of hot water sweetened well with molasses, also bathe the throat and stomach faithfully with the medicine, clear.

Dr. Sweet says it takes out the soreness in cases of hemorrhoids faster than anything he ever applied.

Fishermen, so often exposed to cuts by having their skin pierced with hooks, and fins of fish, can be relieved by bathing with the Pain Killer as soon as the accident occurs; in this way the anguish is soon abated; bathe as often as once in five minutes, say three or four times, and you will seldom have any trouble.

The bites and scratches of dogs and cats are soon cured by bathing with the Pain Killer clear. may-ly

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on this day's copy—which is the very latest hour we can receive advertisements.

Altona Gravel Mining Company. Location of Works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the twenty-third day of May, 1871, an assessment of five (5) cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the Company, No. 25 Merchants' Exchange, San Francisco.

Hanscom Copper Mining Company.—Location, Low Divide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of April, 1871, an assessment of five (5) cents per share was levied upon the capital stock of said company, payable on or after the 8th day of May, at the Secretary's office, 21 and 23 First Street, Office Golden State Iron Works, San Francisco, California.

Kincaid Flat Mining Company—Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of April, 1871, an assessment of two dollars and fifty cents (2.50) per share was levied upon the capital stock of said company, payable immediately, in U. S. gold and silver coin, to the Secretary, No. 220 Clay street, San Francisco.

Latawana Mining Company, near Hamilton City, White Pine, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of May, 1871, an assessment of Twenty Cents (20¢) per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, 614 Merchant street, Room 26, San Francisco, California.

Mauntau Silver Mining Company—White Pine District, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 24th day of April, 1871, an assessment of five cents per share was levied upon the capital stock of said company, payable immediately, in U. S. gold coin, to the Secretary, at the office of the company, 37 New Merchants' Exchange, San Francisco.

Mina Rica Mining Company—Location of works, Auburn Mining District, Placer county, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 25th day of April, 1871, an assessment of Twenty cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the Company's office, Room 2, No. 418 California street, San Francisco, Cal.

Mohawk & Montreal Cons. G. & S. M. Co., Meadow Lake, Nevada County, State of California.

Notice.—A special meeting of the stockholders of the above named company for the purpose of electing Trustees and such other business as may properly be brought before the meeting, will be held on Tuesday, the 27th day of June, 1871, at 3 o'clock, p. m., at the office of R. Wegner, No. 414 California street, San Francisco, Cal.

Nevada Land and Mining Company.—Location of Works, Steptoe, Johnson and Latham, Antelope and Clifton District, Elko County, State of Nevada.

Notice is hereby given that at a meeting of the Board of Trustees of said company, held on the 8th day of May, 1871, an assessment of four (4) cents per share was levied upon the capital stock of said company, payable immediately in U. S. gold coin, to the Secretary, at his office, Room 5, No. 302 Montgomery street, San Francisco, Cal.

Salamander Gold and Silver Mining Company, Leon's Ranch, Mill Valley District, Calaveras County, Cal.

Notice is hereby given, that at a meeting of the Trustees of said company, held on the 14th day of May, 1871, an assessment (No. 8) of thirty-five cents per share was levied upon the assessable stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, J. J. Pfeiffer, at the Police street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 12th day of June, 1871, shall be deemed delinquent, and will be sold for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of July, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

BERRY & PLACE, Importers and Dealers in MACHINERY AND SUPPLIES. SAN FRANCISCO, CAL.

Solo Agents in Pacific States for Sale of Blake's Patent Steam Pumps, Smith's Wood-Working Machinery, Davis & Furber's Woolen Machinery, The Swain Turbine Water Wheel, Wood, Light & Co.'s Machinists' Tools, Starvevant's Pressure Blowers, Hurdy's Portable Drillers, Dreyfus' Patent Self-Oilers, Gardner's Safety Stop Governor, Page's Belting, Etc., Etc.

Dreyfus' Patent Self-Oilers and Cylinder Cups.

A saving in oil of 75 to 95 per cent. guaranteed. No trouble of "oiling up!" No waste of oil! No oil cans needed!

by the use of the

NATHAN & DREYFUS SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of

75 PER CENT OF OIL.

They are composed of a transparent Glass Cup, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

No testimonials are printed, but ask any one who has them what they think of them. Be sure you get Dreyfus'.

Send for Circular and Price List to BERRY & PLACE, San Francisco.

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used, and the machinery employed especially adapted to their manufacture. Thus

We warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and sith or BLACE ON FINISH, as you may require. Send for Price List to BERRY & PLACE, San Francisco.

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages: First—Nothing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind. Second—Its great economy of both tallow and fuel. Third—It is self acting, and supplies the lubricating material only while the Engine is in motion. Fourth—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be in fact blown out at the exhaust (as must necessarily be the case), this Cup, by its peculiar action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the Cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

For further information or Price Lists, address BERRY & PLACE, Importers Machinery and Mill Supplies, Warerooms, 112 and 114 California street, San Francisco.

Yosemite Consolidated Mining Company, Santa Fe District, Lander County, Nevada.

Notice is hereby given that the Annual Meeting of the stockholders in the above named company will be held at their office, No. 28 Merchants' Exchange, California street, San Francisco, California, on Monday, the fifth day of June, 1871, at 12 o'clock M., for the election of Trustees, and the transaction of other business. By order of the President, DAVID WILDER, Sec.

TO THE MINING INTEREST.—Believing that they can thereby aid the Mining interest, the managers of the Eighth Industrial Exhibition of the Mechanical Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL to OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanics' Institute, care J. H. Gilmore, San Francisco.

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee
that the purchasers shall be under no expense for re-
pairs for TWELVE MONTHS, and guarantee the mill to
crush (regular work) One Ton Per Hour of the Hardest
Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.
To put one of the Wilson Mills over the mountains,
from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and
repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its
merits. One can always be seen at the Pacific Iron
Works.
Ten of these Mills are now in operation.
For further particulars address

FURMAN R. WILSON,
San Francisco.

STEAM JET PUMP.

Blakeslee & Williams' Patent, For
Water, Oils, Acids, Etc.

The best cold water
pump for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.

We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it oper-
ates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. C is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before re-charging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the injection of the lubricant from the oil chamber; the rapidity of action being regulated by the valve B and C.

TRAVIS & WAGNER!

MANUFACTURERS OF French Burr Mill Stones, Portable Mills of all sizes,

from 16 to 36 inches, for grinding Corn, Barley, Feed, Salt, Paints, Drugs, &c. Mills specially adapted for grinding Quartz. 2v22-lyns 41 First st., San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

Gold Saving Amalgamated Plates.

Miners, Quartz Millmen—Attention.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivaled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels, of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester; Orosse and Blackwell, London, &c. &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v22-lyew

WALTHAM WATCHES.

In soliciting anew the public patronage of WATCHES of domestic production, the AMERICAN WATCH COMPANY respectfully represent:

That no fact in the history of manufactures is more completely demonstrated than that the best system of making Watches is the one first established by them at Waltham. That system always had the warrant of reason and common sense, and now the test of time in the trial of the Watches themselves cannot be denied to have been ample and satisfactory. It is admitted on every hand—the evidence of daily observation and common reputation—that the Watches not only keep correct time, but that as machines they ENDURE. It should seem that nothing more is needed, but that their sizes, shapes and appearance should suit the tastes of the people. As to all these conditions the American Watch Co. are now fully prepared to answer the exactions of the market. They confidently assert there is no longer any need for such reasons to import watches of any description whatever. Every size in ordinary demand, every shape and every variety of finish and decoration, may now be had. And as to price, the recent reductions leave no room for doubt that the Waltham system of Watch-making is

The Most Economical as well as the Most Reliable,

And that the Waltham Watch is the Cheapest as well as the Best.

Many new varieties of movements have been added during the last year, all of which display the latest improvements in design and finish, and evince the rapid progress the Company is making toward perfection in the art. Among these the new small size Watch, for Boys and young gentlemen, is to be specially noted. A very low price has been made for this Watch because it is a boy's watch, and with the object of bringing it within the means of boys of all classes. Price being considered,

No such Watch, in Quality and Beauty,

Has ever, in any country, been produced.

The "CRESCENT-STREET" FULL PLATE WATCH, added during the last year, is now made either with or without stem-winding and setting attachment. This Watch, in either form,

The Company Challenges all Manufacturers of all Countries

To beat or equal for its price. It is made with all the latest improvements in every part—improvements which improve—and which not only make it better for its purposes as a timekeeper, but will make it the great favorite with Watchmakers. This, the highest grade of full plate Watches made in this country, in size and appearance, in finish, and general excellence, is especially intended for and recommended to business men, and in particular to Railway and Expressmen, to constant travelers—in fact, to all live men who must be told by their Watches the correct time of day whenever they want it. All such men should have the

"American Watch Co., Crescent Street."

Counting on such destination for this variety of their manufacture, the company devote the greatest care to its construction, employ upon it only their best men and best machinery, and issue it with their reputation at stake upon its success.

For sale by all leading jewelers. No Watches retailed by the Company. For all other facts address

THE QUARTZ OPERATOR'S HAND-BOOK,

BY P. M. RANDALL.

REVISED AND ENLARGED EDITION.

CONTENTS:

APPLIED MECHANICS—Thin Cylinders, Thick Hollow Cylinders, Relative Grinding Capacity of differently formed Grinding Plates, Friction, Water Pipes, Velocity of Streams, Water Power, Water Wheels, Steam Power, Assay—Mechanical Assays, Dry Way of Assay, Humid Way of Assay, Assay or Analysis of Iron Ores containing Manganese, Assay or Analysis of Ores containing Gold, Silver, Copper, Lead, Iron and Sulphur.
BEHAVIOR OF SOLUTIONS OF METALLIC OXIDES WITH REAGENTS—BLOW-PIPE—EXAMINATION OF MINERALS.
GOLD—Treatment of Ore Containing Gold: By Smelting: By Amalgamation: By Chlorination.
MILL—STAMP—SILVER—GOLD.
MINERAL VEINS—Species of, Formation of, Exploration of, Exploitation of.
MINES—VENTILATION OF.
QUARTZ MACHINERY—Rock Breakers, Batteries, Mortars, Tappets, Cams, Cam-Shaft, Stamps, Dies, Screens, Guides, Grinders and Amalgamators, Wheeler and Randall's Excelsior Grinder and Amalgamator, Separators, Wheeler and Randall's Conoidal Separator, Concentrators, Wheeler and Randall's Eureka Concentrator, The Wheeler and Randall Tuber Concentrator and Amalgamator, Retorts, Gold Retorts, Silver Retorts, Crucibles, Ingot Molds.
REDUCTION AND CONCENTRATION OF ORES—DRY WAY.
ROASTING—Heaps, Furnaces.
SMELTING.
SILVER—Ores of Silver, Treatment of Silver Ores: By Smelting; By Solution; By Amalgamation; Extraction of Silver from coarse Copper, Extraction of Silver from Copper Matte, Sodium Amalgam, Purification of Mercury, Quicksilvering of Copper-Plate, Cupellation of Gold and Silver, Refining of Gold and Silver.

PATENTS BOUGHT AND SOLD ON COMMISSION.

DENTISTS, READ THIS.

Dr. Gillespie's New Patent Atmospheric Attachment TO DENTAL PLATES.

Can be applied to both New and Old Plates, so as to retain them firmly in the mouth while eating or talking: superior to any thing ever before invented, cost of applying it small, and the greatest improvement immediately felt by the wearer.

All who have badly-fitting plates can, by the application of this Attachment, wear them with perfect comfort and usefulness while eating, talking, etc. State, County and Office Rights for Sale.

PATENTED ARTICLES FOR AGENTS:

Richards' Corner Protector.

This is a novel and beautiful invention. It completely prevents dust from settling in the corners of rooms or stairways, and at the same time makes a very fine finish. They sell very readily. Send 50 cents for samples.

Finger Guards.

No lady who sews can afford to be without one of these Guards; and no Book Agent who understands his business will fail to order a good supply as soon as he sees them. It completely protects the left fore-finger from being pricked by the needle. Retail price, 50 cents.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,

Somewhat slower in its Explosion, which we recommend for

BLANK BLASTING, COAL MINES,

AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD. It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price, 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

VOLUME XXII
Number 22.

Work at the City Foundries.

Work at the city foundries has been better of late than it has been for a long time previous. Indeed, if we had had a wet winter, with plenty of water for the minors, according to appearances, the palmiest days of the business would be equalled during the present season.

THE RISON WORKS have been crowded with business. They are making a large 20-inch engine for deep hoisting at the Crown Point mine. A similar engine is being made for the Yellow Jacket. Their work on the Mohonga has just been finished. This last is one of the most important things which has been done here for years, and we hope to give a detailed account before long. The Works have a large job on machinery for the City Gas Company.

In water pipes they have also had very much to do. They have made a large amount for the San Mateo Water Company, for the Woodland Canal and Irrigating Company, of Yolo County, and for the Los Gatos Manufacturing Company; also three or four miles extra of water pipe, of 37½, 30 and 22 inches in diameter. They are very busy manufacturing car-wheels, which they have made an important branch of their business. They have made a heavy steam winch for the Santa Cruz, and have had other jobs in large number. A large steam hammer has just been added to the works.

THE PACIFIC WORKS have lately completed a 15-stamp mill, with pans, settlers, etc., complete, for the English mining company in Troy District, Nevada; also a 20-stamp mill complete for the East Eureka Company, at Grass Valley. They shipped off, in the last steamer, a large amount of work for Mexico,—sugar machinery, engine and boiler, for Hermosillo, etc. For Eureka, White Pine and Owen's River, they are turning out considerable iron work for smelting furnaces. For the Metropolitan Gas Company, of this city, they are engaged on a heavy order for cast iron pipe, of 6, 8 and 16-inch diameter. Of the 8-inch pipe they have made about 1¼ miles, and of the 16-inch pipe some two miles.

THE GOLDEN STATE FOUNDRY has been making a large amount of amalgamating machinery, Stevenson pans, settlers, etc., for the Nevada Buttes Company, at Battle Mountain, Nevada. They have had orders for Knox pans to go to Plumas county and also to San Diego county. They have been engaged on an improvement of the Roberts ditching machine, which they have been constructing for the California Peat Company. They are making two or three thousand feet of water pipe for Oregon, and have considerable bridge work on hand, for Howe Truss bridges. Their foundry has been kept very busy on white iron for pan and stamp shoes and dies.

THE AETNA WORKS are also having a lively time. As we have previously stated, the Hyde Road Steamer was built at these works, which did themselves credit in the matter. The steam pump, invented by

Mr. Hanscom and used on this steamer, is having quite a demand, and several have been made for Oakland and other places for irrigating purposes. A 5-stamp mill is being built for the San Diego mines. A lot of shafting and engine are being turned out for the National Brewery, and a similar lot for the New York Brewery. Shafting, gearing, etc., are being constructed for saw-mills in Oregon, and castings for the saw-mill of C. A. Simpson, at Coos Bay. An iron house-front is being cast for Mil-

THE FULTON FOUNDRY is building a flouring mill for Arizona, with 14x24 inch engine and boiler 48 inches x 16 feet. It has just completed, for S. M. and A. Duncan, a 10-ton locomotive for hauling logs to their saw-mill, on Russian River, and also a lot of cars for the same. It has been turning out a large amount of castings for Selby's shot tower and smelting works, for the Golden City Chemical Works, the S. F. Chemical Works, and the Spring Valley Water Works. It has orders

lasting and less reliable and efficient.

Several years ago, Messrs. E. Ball & Co., of Canton, Ohio, determined to build their "World Reaper and Mower" on the same plan as that on which they would construct a lathe,—that is, to have every part accurately cut and fitted, so as to ensure ease of running and consequent durability, provided exposure did not defeat their plans. They determined to make a cut-gear harvester, and after months of labor and large expenditure, they completed, in 1866, the first article of the kind ever built.

The practical history of their machines has proved that an accurately constructed device of the kind will stand the wear and tear and exposure even better than rough-cast machines. They claim that they work better and more easily, and are far more durable than any others.

We have previously given a general view of the World Reaper and Mower. We now add an inside view of the machine.

The materials are for the most part iron and steel. The gearing is one of its very chief points. As intimated above, this is cut, to avoid the imperfections of cast gear. The gearing is cast solid, larger than it is to be finally, and then turned down upon a lathe to the required size, which is fixed by an accurate gauge. Then the cogs are cut with the greatest exactness and bored with precision. The shafting and other parts are prepared in a similar way. The shafting is turned throughout its entire length, and fitted to the wheels (into which it is driven with vigorous force and then keyed) so firmly that wheels and shafting are as immovably united as if of a single piece.

The frame is a solid iron shell, into which the hearings and conformations for the gearing are cast. Its form is such as to combine strength, solidity and lightness. The bolt-holes, etc., as well as the bolts and nuts, are cut and turned, and all joints are planed so as to unite perfectly.

The gearing is protected from below by the shell case or foundation, into which it is fitted, and from above by a closely fitting hinged cover. Thus all the vital parts are secured from injury from water, dirt, and the like. The attachments, embracing the most improved devices in use, and some belonging exclusively to this machine, are built with the same excellence and of the best material, as are the other parts.

The result is a smoothly running, noiseless machine, which does not rack or jar, and which requires the minimum of power. The implement was introduced sometime ago on our coast, and has been warmly received. It took, moreover, all the premiums at the California State Fair of 1870, awarded for mowers and reapers.

The manufacturers are Messrs. E. Ball & Co., of Canton, Ohio. They have appointed as general agents for the Pacific coast, Messrs. Linforth, Kellogg & Co., 3 and 5 Front street, San Francisco. Persons desirous of further information may apply to either of the above-named parties.

WORLD REAPER AND MOWER—INSIDE VIEW.

ton S. Latham, for a building on Market, between First and Second streets; also one for the Odd Fellow's Hall at Petaluma. Besides these, work is being done for the State Capitol, and on various jobs.

At the MINERS' FOUNDRY, work is going on briskly. The casting of the columns, etc., for the State Capitol, at Sacramento, is still employing a large number of men. Quartz crushers are being built for Mexican mines; and on the Blatchly drill several slight modifications are being made, and a machine of smaller size, to weigh about 75 lbs., is being constructed. In addition, the establishment has a large number of orders for various work.

for some 45 tons of shoes and dies for Silver City, Idaho; and is making a lot of pans and a White (cylinder) roasting furnace for the Citizen's Milling Company, of Austin, Nevada. A large sawmill is being built for Ione City, Amador county, and 12 sets of car wheels for the Coos Bay Mining Company. The works are kept running day and night.

The World Reaper and Mower.

It has been a common source of complaint among farmers, that agricultural machinery is not so well made as is that of the shop,—that it is rougher, less

MECHANICAL PROGRESS.

OZOKERIT.—This is a vegetable wax from the Caucasus. Its manufacture into blocks for candle-making, is patented in England, and the process, as carried on at Battersea, by the Messrs. Field, is thus described by *Engineering*:—"Commencing at the river end of the premises, we found a large store of the ozokerit in two conditions, in the one as dug from the earth, and in the other as roughly melted down for convenience of storage in transit. In the latter condition it forms a dark-colored mass, and is packed in barrels, the native or unmelted ozokerit being sent over in canvas bags. From the stores the crude material is conveyed into melting tanks, holding from 2 to 3 tons each, and where it is melted down by means of a steam coil. From these tanks, which are situated in a gallery some 15 ft. above the ground level, the ozokerit is run off by gravitation to a series of stills placed outside the main building, and holding from 2 to 3 tons each, and in which it is distilled over, partly by steam, and partly by bottom heat. The dirt and bottoms from the crude ozokerit are run off from the melting tanks into another set of tanks beneath them, where they are remelted, the finer products being afterwards distilled over. The ozokerit comes over from the stills in the form of an oily distillate, which is run from the condensers into moulds and allowed to cool. This gives a deep yellowish wax-like substance of a spongy nature, the pores being filled with oil, which exudes under a slight pressure. These cakes are packed between oil-skins and canvas cloths and placed in hydraulic presses, of which there are three of large capacity. The pressed cake after removal is put into reheating tanks and again melted down, and pumped from these tanks by a steam pump into the acidifiers where it is treated with a sulphuric acid. These acidifiers are steam jacketed and are fitted with revolving agitators by which the ozokerit and acid are agitated together for a certain time, after which the mixture is allowed to settle. After settling, the purified ozokerit is drawn off from the lower part of the acidifiers—the acid remaining on the top—and run into vessels which are heated by bottom heat. This is the final heating, and from these vessels the fine stuff is drawn off into moulds, the result being a hard white wax, the melting point of which is 140°, that of paraffine wax being only 128°. These blocks are sent to Messrs. Field's works at Lambeth, and from them the now well-known ozokerit candles are made."

RANSOME'S NEW STONE.—*Engineering* for May 5th gives the results of experiments made to ascertain the power of resistance to crushing, possessed by this material. Sixteen specimens, cubes of four inches, prepared ten weeks before, and therefore well hardened, showed an average strength of 51 tons. The average strength of Mr. Ransome's old stone, at the age of 3 months, was 30 tons, on the four-inch cube. The same journal of the preceding week says a new and doubtless important suggestion has been made in regard to the use of this stone for caissons in the construction of hydraulic works. A calculation is gone into which shows it to have an advantage of nearly 50 per cent., as regards cost, over iron for the same purpose.

PROGRESS AT HELL GATE.—The extent to which the ten headings radiating from the vertical shaft have been pushed, amounted in all to 529 feet on May 7th, averaging some 53 feet each. The headings average 20 feet in height by 13 feet in width. The rock is extremely hard. Most of the drilling has been done by Cornish miners with hand drills. A diamond drilling machine has been at work since January in one of the headings. There will ultimately be concentric galleries crossing the headings at intervals, and the piers between these will contain T-shaped chambers, to receive the final charges of powder, which will be simultaneously fired by means of electricity.

NEW COMBINATION BANK LOCK.—At the meeting of the Polytechnic Club, April 27th, was exhibited a lock which is thus described:—"The outside of the lock has two knobs or handles, the larger being set to any given position by a circle graduated to 300 divisions. In the interior of the lock are four wheels, each capable of 1,380 positions, (having forty-six teeth, and set by a pinion with ten teeth moved by the graduated handle,) affording, therefore, more than three millions of millions of changes. The pinion is connected separately with the four wheels and with the ratchet which moves the bolts by the smaller knob. As the bolts cannot be opened unless all four wheels are in exact position, and it cannot be known on trial which is out of position or whether any one or more are in position, and as it cannot be known except by trial of the bolts whether the wheels are all in position or not, there is no chance to "feel," and no mitigation of the full number of trials to be made. Yet the lock may be closed in an instant; and in case the lock is to be closed for a short time only, as in a safe during office hours, one wheel only need be thrown out of position in locking, so that it may be opened in five or six seconds with a knowledge of the mode of locking, and yet a person not knowing that it was so locked would probably disarrange the other wheels, involving all the changes. The combination can be easily changed, by changing the position of a screw in one or more of the four wheels."

HOOPER'S INSULATION OF SUBMARINE CABLES.—It is said that the Hooper core, from its superior insulating properties, will transmit thirty per cent. more words in a given time than a gutta-percha core. The following description of the manner of preparation is from an article in *Nature*, by N. J. Holmes:—"The copper conductor, after being tinned, is coated with pure india-rubber applied in the shape of a ribbon, lapped spirally round it. Next, two strips (one laid above and the other below) of india-rubber, chemically prepared to resist the action of sulphur, and called the "separator," are applied so as to completely surround the first rubber-covering, as it were with a tube; a pair of grooved die-wheels giving the contour, and at the same time regulating accurately the gauge of the core. Exterior strips are then similarly applied of a compound of rubber and a small percentage of sulphur. The whole is then lapped round with water-proof felt tape, and exposed for some hours in an oven to a heat of about 383° F. By this process the three successive coatings are welded into one solid, dense, homogeneous mass, having its distinctive features preserved as regards the individual character of the several layers. Thus the heat, in driving off the sulphur from the outside coating, has converted that envelope into an indestructible vulcanized rubber jacket. The second layer, or "separator," has intercepted the passing of the sulphur by reason of its chemical properties, while at the same time it has allowed an infinitesimal trace of the sulphur to combine with the internal coating of pure rubber round the conducting wire, sufficient to change its character into an indestructible and non-liquifying material, without its becoming in any way vulcanized."

DESACHY'S FIBROUS PLASTER.—A great portion of the interior architectural decoration of the present day is simply sham. But it answers every purpose. *Papier mache* (pressed paper), and *carton pierre* (stone made of card-board), are largely used. But the *London Architect* notes another material, named in the heading of this item. We quote:—"It is a combination of ordinary fine or common plaster and canvas. The plaster is cast very thin, less than one-fourth inch, in a mould, and then upon the back of it is laid the canvas, which becomes incorporated with it as it sets; the shape is supported by light strips of wood, laid on at the same time; and for the plain mouldings and large panelling, this system gives all the usual effect, combined with extreme lightness and facility for fixing. As an instance, we saw a large circular moulding, more than seven feet in diameter, for surrounding a light, made in one piece, ready for fixing, no portion of the face of which was more than a quarter of an inch in thickness. We may mention the ceiling of the library of the new Record Office, as an instance of its use, the apparently massive Gothic ribs, forming the groins between the skylight, being of this material, screwed to wrought-iron girders inside, which really do the work."

SCIENTIFIC PROGRESS.

THE MECHANICAL CORRELATIVE OF THOUGHT.—Following is an extract from Prof. Tyndall's lecture on the "Scientific Uses of the Imagination":—"The philosophy of the future will assuredly take more account than that of the past of the relation of thought and feeling to physical processes; and it may be that the qualities of the mind will be studied through the organism as we now study the character of a force though the affections of ordinary matter. We believe that every thought and every feeling has its definite mechanical correlative; that it is accompanied by a certain separation and remodelling of the atoms of the brain. This latter process is purely physical; and were the faculties we now possess sufficiently strengthened, without the creation of any new faculty, it would doubtless be within the range of our augmented powers to infer from the molecular state of the brain the character of the thought acting on it, and, conversely, to infer from the thought the exact molecular condition of the brain. We do not say, and this, as will be seen, is all-important—that the inference here referred to would be an *a priori* one. But, by observing, with the faculties, we assume, the state of the brain and the associated mental affections, both might be so tabulated side by side that, if one were given, a mere reference to the table would declare the other. Our present powers, it is true, shrivel into nothingness when brought to bear on such a problem, but it is because of its complexity and our limits that this is the case. The "quality" of the problem and the "quality" of our powers are, we believe, so related, that a mere expansion of the latter would enable them to cope with the former. * * * The territory of physics is wide, but it has its limits from which we look with vacant gaze into the region beyond. Whence come we; whither go we? The question dies without an answer—without even an echo—upon the infinite shores of the Unknown."

THE NUMBERING OF RAPID VIBRATIONS.—Prof. Tyndall exhibited at a late lecture before the Royal Institution, an instrument called a syren, for determining the number of vibrations, in a given time, of an insect's wing, or any other vibrations which produce a musical sound. A current of air produced by a bellows is driven through a tube so constructed that the current is cut up into puffs by a rotating arrangement, giving a musical note which is more or less high, in pitch, as the puffs are more or less rapid. An index shows the rapidity of the rotation, and therefore of course the number of vibrations of the body of air; and it is therefore only necessary to urge the rotation until the pitch of the tone produced agrees with that of the sound produced by the vibrating body, when the index points out the number of its vibrations in a second.

NEW PYROMETER.—At the late *soiree* of the Royal Society, in London, C. W. Siemens, C. E., exhibited a pyrometer, in using which a spiral of platinum wire is heated in a furnace; as the wire grows hotter its power of resisting the passage of a current of electricity increases, hence the temperature of the furnace can be determined by means of a galvanometer, which measures the electrical resistance of the platinum spiral.

VARIABILITY VS. NATURAL SELECTION.—Edward Fry, in a communication to *Nature*, remarks upon the showing by Mivart that Darwin has ignored the existence of the law of Variability in favor of his pet law of Natural Selection, and attributed to the latter exclusively, the origination of new species. Mr. Fry agrees with Mivart in his demonstration that, in the struggle for existence, the numerical superiority of the original form gives it an immense advantage over the new variation; and adds, that the useful variety has not only this advantage to overcome, but has also to overcome the tendency to reversion to the original form. He goes into a course of

reasoning by which he shows, that in the second generation the chances against the continuance of the new variety are 79 to 2; and remarks as follows:—"These chances express the force of the tendency against which Natural Selection has to operate, assuming that the numbers of each variation at starting were equal to those of the original form; but this is, on the assumption that variation is accidental, infinitely removed from the truth; and if the difference between the numbers of the original form and the variation be introduced into the case, the odds are indefinitely increased against the accumulation of a casual variety. None of these observations go to show that Natural Selection does not exist (I have no doubt that it does), but they show that it has a most uphill game to play, and one in which it is improbable for it to win without help from some other principle."

POISON OF THE COBRA.—At a late meeting of the Boston Society of Natural History, Mr. George Seavey, who has been attached to the India Museum at Calcutta, and assisted Dr. Fayrer, Professor of Surgery in the Medical College there in his experiments upon the venomous snakes of the country, read an account of one performed upon the Cobra. We find it in the *American Naturalist* for May. The inguinal fold of the skin of a dog was held by two pairs of long-bladed forceps in such a manner as to include a triangular piece of about three inches in length. The Cobra's fangs were applied to the middle of the free edge, and with a sharp scalpel, held in readiness, the fold of skin was at once cut out, and yet the dog died from the effects of the poison in fifty-nine minutes. Dr. Fayrer, in his report, made the following comments:—"The bitten part was not merely excised, as we speak of excising the parts around the spot which the fangs had penetrated, but the fold of skin into which the fangs had injected the poison was removed within a second after the bite; for the knife had entered almost before the fangs had left. In fact, it could not have been done more rapidly, and yet, within one hour, the animal was dead from the effects of the poison. The infinitesimal portion of time during which the Cobra's fangs were inserted in the tissues was sufficient to have sent the poison through the circulation beyond the reach of incision."

COLOR OF THE SKY.—The following is from Mr. Glaisher's "Travels in the Air,"—just published by Bentley, London:—"The azure color of the sky, though resembling the blue of the first order when the sky is viewed from the earth's surface, becomes an exceedingly deep Prussian blue as we ascend, and, when viewed from the height of six or seven miles, is a deep blue of the second or third order. 2. The maximum polarising angle of the atmosphere, 45°, is the same as that of air, and not of water, which is 53°. 3. At the greatest height to which I have ascended, namely, at the height of five, six, and seven miles, where the blue is the brightest, the air is almost deprived of moisture. Hence it follows that the exceedingly deep Prussian blue cannot be produced by vesicles of water, but must be caused by reflection from the air, whose polarising angle is 45°. The faint blue which the sky exhibits at the earth's surface is therefore not the blue of the first order, but merely the blue of the second or third order rendered paler by the light reflected from the aqueous vapour in the lower regions of the atmosphere."

INGENUOUS APPLICATION OF THE SPECTROSCOPE.—Says the *Quarterly Journal of Science*:—"The water used by the people of a crowded court, amongst whom several cases of typhoid fever had appeared, was drawn from a rather shallow well, and was highly charged with various unoxidized compounds of nitrogen. It was suspected that, from some defect, the contents of a public urinal obtained entrance to the well. The fact that the well-water contained seven times as much common salt as the normal water of the vicinity was some confirmation of the suspicion. Prof. Church obtained absolute proof by the following method. He introduced two grammes of a lithium salt into the urinal, and, two hours later, was enabled readily to detect with the spectroscope the presence of lithium in a litre of the well water, which by previous examination had shown no trace of this substance."

CORRESPONDENCE.

Wastage of the Precious Metals.—No. 1.

BY ALMAHIN B. PAUL.
[Written for the Press.]

The fact that a high percentage of the precious metals is lost in the manipulating of ores by the present modes of working, no one for a moment questions; but when it comes to any special data, but little has been presented to the public. Some assert their loss to be only a trifle, while others, who more closely investigate, know it to be greater than it should be. Shakespeare says, "He who knoweth not what is lost, loseth nothing;" and in that sense, some lose nothing. Having closely investigated the subject for the past two years, I find the average loss, especially in California, so great, that really I think, if there is not more care taken in the husbanding of our riches, when extracted from the earth, that the Government should take measures to do so.

Our Gold Milling Defective.

There is an idea that all gold is readily amalgamated, and therefore it is not necessary to be so particular; consequently there is an unwarrantable degree of carelessness. I have learned by practical working in both gold and silver that a higher percentage of silver is more readily obtained by the known system of working for silver, than the percentage of gold by its most advanced system, showing that gold milling is far behind silver working, although as before remarked, gold is considered so "readily amalgamated." Yet to adopt the systems for gold that are used in silver, affords no especial relief.

That my readers may have some data, as a corner-stone, to build their ideas upon, before I go too far in my general observations, I will give a few tests of the many which I have made in the last two years, and intersperse with them, as additional evidence, tests of other parties. And here I would call the reader's especial attention to the fact of a goodly percentage of silver in all of our California ores; and I will also remark that the assay of tailings does not even show what percentage of silver the ores may contain, as some may be in the form of chlorides which move off in the water. But to the tests of our gold mining.

TEST No. 1.—Average yield of ore in mill, \$18.60. Wastage after complete washing, including concentrating.—Silver, \$3.14; Gold, \$10.04; total \$13.18.

TEST No. 2.—Same mill tailings 350 feet from mill.—Silver, \$3.93; Gold, \$5.02; total, \$8.95. Showing that a percentage secreted itself in its passage down stream.

TEST No. 3.—Average yield of 150 tons, \$3.50. Assays of tailings carefully sampled.—Silver, \$6.28; Gold, \$13.55; total, \$19.83. Silver, \$6.28; Gold, \$8.79; total, \$15.07.

The above bad results were occasioned by the extreme fineness of the gold. And even the above does not show the full wastage. To corroborate this, I will give some admirable tests made to get at the question of "float gold."

A friend of mine, having somewhat similar ideas to my own, concluded to, test the question of float gold as well as he could at the time, and embraced the opportunity of cleaning up the slum from a water tank for supplying the battery, where the water was used over and over again in consequence of its scarcity. The ores were worked after the usual wet method for gold ores. The water and pulp were first passed through a sluice to tailing bed, 190 feet. The tailings being deposited, the water was drawn off at the top, flowing into a well, where it was raised, and passed through a sluice 120 feet to tank at battery. This is the tank cleaned up.

The residue was amalgamated in a tub quite rudely, but with a large body of mercury and chemicals. The result was \$33 in silver and \$56 in gold, making a total of \$89 per ton. It will be observed that there were two chances for the metals to precipitate previous to reaching this tank:—first, in the tailing reservoir, and second, in the well.

Other Important Tests.

This "float" metal question is further established by a system of tests made by Mr. G. McDougal, of Grass Valley, who very kindly allowed me to extract the same from his books of tests. And here let me say that these tests are made from water flowing from mills at a point three-fourths of a mile below the mills.

1st test of 20 gallons of water gave.....	1.10 cents
2d " " " " " " " " " " " " " " " "	2.13 "
3d " " " " " " " " " " " " " " " "	.95 "
4th " " " " " " " " " " " " " " " "	.83 "
5th " " " " " " " " " " " " " " " "	1.02 "
6th " " " " " " " " " " " " " " " "	1.13 "
7th " " " " " " " " " " " " " " " "	.97 "
8th " " " " " " " " " " " " " " " "	1.12 "
9th " " " " " " " " " " " " " " " "	1.07 "
10th " " " " " " " " " " " " " " " "	.83 "
11th " " " " " " " " " " " " " " " "	1.01 "
12th " " " " " " " " " " " " " " " "	.90 "

Average.....1.18 "

It was estimated that 576,000 gallons of this "muddy water" flowed by every 24 hours, which, according to these tests, contain \$339.84. Let us carry this calculation a little further.

The average amount of ore worked in 24 hours was given as 58 tons. This shows that \$5.85 per ton "floats," which probably is at least 20 per cent. of the yield. Let us run this loss a little further. Suppose the two mills run 250 days in each year, which is not unreasonable, and we have a yearly loss in "float gold" alone, to say nothing of loss by imperfect pulverization and general wastage, of \$84,960.00 from two single mills!

Extend the test as far as you may on a smaller or larger scale, and wastage stares one badly in the face at every turn.

I made a test of 50 pounds of tailings for a party who took them a mile below his mill, and the return was 55 per cent. of what was

KRUPP'S STEEL WORKS AT ESSEN, PRUSSIA.

his average working. I also made a test of three-fourths of a ton, and the result showed the loss in the mill-working to be 63 per cent. I could write every column of your paper full of tests corroborative of the fact of the enormous loss in the milling of our gold ores. But these given should be as convincing as more; and I hope enough so, as to awaken a desire for investigation at least. From what attention I have given the subject in actual labor, as well as collecting all the data attainable from others, I know that the loss as a whole is fully 50 per cent., and, in the majority of mills, all of 60 per cent. of what the ore contains.

We Must Consider This Question.

I can now ask: Is it not time that we were beginning to consider this question of the wastage of the precious metals? It is this that produces so many failures, such utter loss of capital. Investments are made in mining on assays of well sampled ores of the mines, but not until machinery is running, do they realize the fact that only a small percentage of the metal is saved, and a failure too often is inevitable. There are a number of institutions in California that have proved grand successes. They have been exceedingly fortunate, but their success may be attributed to having ores of high value, not to gaining a high percentage of the metal. For take California mills, and the first class are all on a par in wastefulness, while the poor are not to be considered at all. My tests are from the best, and I leave the reader to fancy what the poorer ones may be.

California in twenty-one years has produced over \$800,000,000, and wasted \$1,000,000,000 more!! For the wastage in "sluicing" is greater than that in quartz mining. The Sacramento river in ages to come, and when it shall be upheaved as were the Sierra Nevada, will gladden the heart of some straggling miner with an auriferous stratum, the wealth of which will throw all histories of Potosi's, Comstock's and Del Rey's combined, into the shade.

To remedy the evil, more care must be taken. The fact is, we are too much of

a rushing, reckless people; we have not got sobered down yet; and I don't know as we ever will. It's rush, rush, and make too little solid, permanent, profitable headway. We have oceans of wealth surrounding us, and ought to be the most opulent, refined and wealthy land on earth,—the load-stone for God's creation. But how is it, and why is it, that we are not?

Krupp's Steel Works.

(Continued from Page 323.)

In consequence of incomplete drawings, I cannot continue this description, but will add a few remarks on Krupp's performances in general. The accompanying photograph gives a view of the enormous establishment. The letters denote the different buildings as follows:

A, the water tower from which the water runs to the boilers. B, the chimney for the two big steam hammers, "Max" and "Frederick." A third hammer is called "Hercules." The two first are valued at \$600,000 each. C, the rolling mill for making rails and the plates to connect them. D, the chimney of the puddling works. E, the hammer works for railroad tires. F, chimney for steam hammers or railroad tires. G, chimney of the locomotive wheel factory, in which Mr. Krupp worked himself at the beginning of his career. H, Krupp's residence. J, melting furnaces for cannon and for crank shafts for steamboats. K, rolling works for

The large crane is able to lift 1,500 hundred weight, and possesses a bearing of 700 feet. A cannon of 400 hundred weight has been ordered by the Japanese ambassador. For making the ingot of such a heavy piece, 800 men are present, and the work is done in less than 10 minutes; yet the men have to stand such a heat that two hours are allowed them for recreation.

The largest piece of ordnance yet made in this establishment was for the Russian government, and has a weight of 500 hundred weight, and throws a ball of 600 pounds.

A new rolling mill rolls steel plates 14½ feet wide and 1 foot thick, the working of which requires 50 hoilers and 2,000 horse power.

Everywhere new buildings are in progress for the workshops. Thirty-six Belgian brick machines are kept running in the summer time, each of them making 900,000 bricks, amounting in the aggregate to 32,400,000 bricks.

Krupp has bought a tract of land of 600 acres, on the small river Ruhr, about five miles from Essen, for the purpose of building a country seat there. This was necessary, for within a less distance, the ground is shaken incessantly by the blows of the hammers, as by the thunder of heavy artillery.

The above is the description of the steel works of Mr. Krupp's at Essen, of which we have all heard so much, and which have been able to see from the inside except the workmen. The description seems to close somewhat abruptly, but it appears to have been written by a man who, as any process, or piece of information struck him as novel or interesting, had jotted it down, and then had made up his letter from these jottings. I hope that it may give your readers as much pleasure to peruse as it has given those who were allowed an inspection of it here.

W. H. DAFFAIN.

Frankford, Phila., Pa.

Right and Left.

EDS. PRESS:—In a late number of the PRESS, I noticed an interesting article with this title, and with a pretty full discussion of the subject. The lecturer was entirely right, as it seems to me, in the view of the case which he took, viz:—that the tendency of the body was toward the right; and not, as the correspondent stated, to the left. Now, if the writer of that article would take the trouble to experiment a little on the matter in hand, we think he might come to see differently. We have tried it practically and find that the results go to strengthen this opinion. It was done in this manner:

When walking with a friend one day, I requested him, without telling him my object in so doing, to place himself in line with two fixed objects, a tree and a post, and, having done so, with his eyes shut, to endeavor to come as near the post as he could. He did so, and I watched him closely. The experiment was repeated several times, and then I did the same thing myself, requesting him to note to which side my steps diverged. Another time, when out walking with the same person, having told him the object of our experiment, it was tried once more on a piece of ground more level than that used at first.

In all these trials, to the number of 15, only four showed a tendency in the body of the walker to the left, and one of these four was caused, I am inclined to think, by unevenness in the ground. Such are the facts, but I do not wish them to be regarded as entirely conclusive, but as strong evidences.

CURIOSITY.

MISSOURI NARROW GAUGE RAILWAY.—A thirty-mile road is in process of construction from Cape Girardeau to the iron banks in Bollinger county, Missouri, of which one mile is finished. The cost of this mile, laid with T rail, has been \$6,537.60, and the cost of the entire thirty miles is estimated at \$213,000, allowing \$16,875 for culverts, bridges, &c. The road bed is six feet wide on top, following the rise and fall of the ground where it does not exceed seventy feet to the mile, and winding round high hills and steep grades in curves of 200 feet radius, less than one-third that required for the ordinary gauge. Rolling stock sufficient for the requirements of such a road—say two locomotives, four passenger cars, thirty platform cars, and ten box cars—are estimated at \$27,000 additional, making a total cost for road and equipments of \$240,000.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

DIAMOND CLAIM.—*Miner*, May 20th: This property, a north extension of the Tarehish lode, is likely to be again worked. Messrs. Wells and Bolden, the owners, after locating it three or four years ago, ran 60 or 70 feet of tunnel, performing sufficient work under the law of the District to make perpetual title, and as times were dull, went out for work and to look out for capital to open up their claim.—Mr. Wells will probably the coming summer resume operations.

AMADOR COUNTY.

CONEY.—*Ledger*, May 27th: The work of sinking this mine has been stopped, and they are now drifting. At no time have the indications looked as encouraging.

CALAVERAS COUNTY.

WHISKY SLIDE.—*Chronicle*, May 27th: Work has been resumed upon the Matthews & Foster mine. We understand that the mine has been conditionally sold, and the parties who contemplate purchasing are taking out rock that prospects first-rate. It will be hauled to Sandy Gulch for crushing. The quartz is from a shaft 130 feet deep, at which point the lead shows six feet in width. Hardigan & Co., in the same vicinity, are getting good quartz. Their new mill will be in readiness in three weeks.

WHAT CHEER.—The work of erecting machinery is progressing rapidly, and it is expected that it will commence active operations early next week. As soon as the hoisting works are completed the incline will be pushed ahead, day and night, until the channel is reached.

RICH ROCK.—Very rich quartz is being taken from the mine of Horehner Seigler & Co., at Mosquito Gulch. We have seen specimens. The company have been crushing rock of superior quality for some time, but it is expected that the next "clean up" will throw all into the shade.

SULPHURET WORKS.—The reduction works attached to the Palomo mill, in Lower Rich Gulch, are a complete success. At first, owing to some defect trouble was experienced; latterly, the difficulty has been obviated and everything works admirably. The rock from the mine contains a large percentage of sulphurets which average \$100 per ton.

ELDORADO COUNTY.

QUARTZ.—*Cor. of Placerville Democrat*, May 27th: The Eureka on Thursday struck a very rich place which continues to improve as they advance. The ledge is five feet in width at that point. The Taylor Co., having completed their shaft, run a drift twenty feet when they struck the ledge, richer than before. They now have a well defined ledge of five feet in width at a depth of two hundred feet, with good walls and every indication of a permanent ledge, which shows gold in every part of it. They intend to run through the mill one hundred tons, as a trial, before putting up any machinery. They talk of putting up a twenty stamp mill, and sink the shaft two hundred feet deeper.

NEVADA COUNTY.

ROUGH AND READY.—*Grass Valley Union*, May 26th: This old mining town has a prospect of again being lively. Extensive claims have been located and in one case the owners have been for some time hydraulicizing after an outlay of some thousands of dollars.

NORTH STAR.—Same of 27th: The shipment of bullion to San Francisco on the 19th, amounted to \$6,290, or \$1,000 more than for the same time last month.

GOLD HILL MILL.—We learn from Mr. Crase, Supt. of this mill, that it is kept in active operation crushing rock from leads being prospected; the rock this season has averaged far more than rock from the same localities hitherto. Twenty-five tons from the Seven-Thirty ledge, showed a yield equal to any from it in days past.

NORTH BLOOMFIELD.—*Transcript*, May 30th: The tunnel to open the claims to the hed rock, will be run from the Yuba river, and will reach the claims at a point estimated 200 feet below the hed rock, giving ample fall for working. The company is still prospecting. In shaft No. 1, they have run 500 feet each way, demonstrating the channel to be 1,000 feet wide. Here they have taken out as high as \$1,000 a day, the pay gravel being equally distributed. In No. 2, they have struck the mine and in No. 3, they are still sinking, having gone down

160 feet, and finding prospects sufficient for hydraulic mining all the way down. The dam at Bowman's is heavy enough to keep the ditch full, and 8,000 inches now runs to waste. The ditch is running 2,800 inches. They are using three or four pipes with six-inch nozzles, day and night. Black, and Gay & Poquillon are also running and doing well. The French Corral and the Yuba Companies are prospecting on the line of the Bloomfield and Relief Hill channel. The former sunk 40 feet and struck hed rock, and now propose to run an incline to the channel. The Yuba Co. have sunk 100 feet through pipe clay all the way, except a stratum of quartz sand at 80 feet, containing charred wood with some petrifications.

OMEGA.—Mining prospects are excellent. Seven or eight hydraulic claims are worked and two at Diamond Creek. Other companies would be at work, but water can not be obtained. The amount used per week at Omega is 10,500 inches.

The miners in the vicinity of this city are piping away at a lively rate. The amount of water run is 900 inches per day of ten hours. There is a larger demand than the ditches can supply.

EUREKA TOWNSHIP.—The Trinta Co. has been organized for the purpose of opening the channel at Roscoe's Ranch, supposed to be a part of the blue lead, but never prospected at this point.

RELIEF HILL.—The miners are all employed, five claims being worked. The Eagle and Waukashaw are drifting and averaging \$10 to \$35 per day to the man. The Star and Union mines are worked by hydraulic, and the Waukashaw both by hydraulic and drifting.

WILLOW VALLEY.—Some two or three quartz mines are being worked, the Oriental and Murchie mills having been put in operation. The Black Republican Co., after a crushing of fifty-five tons, cleaned up \$25 per ton. The ledge has paid better, but never looked as well as now.

PLACER COUNTY.

GREENE.—*Placer Herald*, May 27th: We prospected a cack of specimens from the mine a few days ago. At the top we found rock about half gold, a little further down the rock showed seven-eighths gold, and from there to the bottom of the bag, say three or four inches it was pure gold, in plates, chunks and slabs.

COLFAX.—*Stars and Stripes*, May 25th: A rich sample recently taken from the Rising Sun mine was sent to J. H. Neff as a specimen of the ore they are now taking out. It is predicted that the yield of the Rising Sun for the current month will exceed that of any previous month.

RATTLESNAKE BAR.—The came has the following: A letter from our correspondent, too late for publication, says that two men, with a rocker last week washed out \$135.

SIERRA COUNTY.

Rich.—*Nevada Transcript*, May 28th: Manuel Gutierrez, an old prospector at the Sierra Buttes, and the discoverer of the Reis, Hawkeye, Independence and Eureka, has recently opened a very rich mine, a specimen from which, on our table, shows a considerable amount of free gold. An assay made in this city, shows it to be worth \$27 per ton. As the ledge is six feet thick, and has only been opened to the depth of 12 feet, this is very rich. On the 13th inst., \$500 in gold was taken out in 10 hours.

The *Sierra Age* of May 24th, says that work will be resumed at the Brush Creek mill and mine as soon as a sufficient force of workmen can be obtained.

SISKIYOU COUNTY.

LITTLE HUMBURG.—*Yreka Union*, May 24: We learn from J. H. V. Barry that the miners where they have commenced to wash up, are doing well. There is a large amount of excellent mining ground still unworked. The drawback is the limited supply of water. Mr. Barry is prospecting a quartz ledge on Punch Creek. He obtains good prospects.

TRINITY COUNTY.

INDIAN CREEK.—*Journal*, May 27th: Mr. R. Silcox has crushed and washed up all the quartz taken out of his ledge on Indian Creek last fall, and tells us the result exceeded his expectations. He has just finished timbering the shaft, put the mill in complete order, and is going to run his mill night and day as long as he can find more quartz of the same sort.

YUBA COUNTY.

HYDRAULIC MINING.—*Appeal*, May 25th: The hed of a former river has been traced from Timbuctoo to a few hundred yards above Sucker Flat, and the richest pay gravel found. Hydraulic mining in this vicinity is not a chance business, but a

certainty. The last clean-up of the Smartsville Co., gave hullion \$53,595. Of this \$15,558 was clear profit. The Blue Point Co. cleaned up 100 of its 350 boxes, and got \$42,000; net profit \$20,000. It cost, however, \$146,000 to run the tunnel. The remainder of the boxes will give, in July, \$80,000 to \$100,000. The Blue Gravel Co. works a diamond drilling machine with four drills, and uses Giant powder.

Nevada.

COPE DISTRICT.

MOUNTAIN CITY.—*Cor. of Elko Independent*, May 27th: The El Dorado has a ledge $4\frac{1}{2}$ feet wide and all mineral that as taken from the ledge mills \$225 per ton. The Independent mine is working only eight men, as they have no opportunity to have their ore worked. The ore requires roasting. Davis' mill is useless at present, the crushing apparatus being almost worthless. That will be soon remedied, the mill having changed hands. The Pride of the West owned by the Hendy Co., bids fair to turn out well. The incline is down sixty feet, and shows rich rock and plenty of it. About 15 or 20 men are "chloriding," across the river, making four to nine dollars a day.

ELY DISTRICT.

BULLION.—*Record*, May 25th: Wells, Fargo & Co. shipped, on May 22d and 24th, by the way of Salt Lake, the following amounts: Meadow Valley Co., \$10,779.60; Raymond & Ely, \$13,879.37. Total, \$24,658.97.

ESMERALDA.

PINE GROVE.—*Carson Register*, May 28th: Yesterday's stage brought in from that section eight sacks of bullion. Arrangements are being made to start up the Keen mine with a full force.

EUREKA DISTRICT.

STRIKE.—*Sentinel*, May 23d: J. B. McGee and Thomas Lynch, between the Otho and Bullwhacker, have exposed a body of ore six feet wide, which they have traced for many feet. It assays high. A sale of 50 feet was made to C. H. Robinson for \$1,000 on the day of discovery.

Seven assays of ore from the El Dorado mine gave in silver and gold, an average of \$289 per ton.

NINETY DAYS.—The assessment roll shows for the quarter ending April 31st, there were worked 3,020 tons, and 1,283 pounds of ore, which gave \$270,629.06 in value. There is more than double this amount on the dumps. We need half a dozen furnaces that will buy ores, and pay a fair price for them.

JACKSON MINE.—Same of 24th: A few days since the workmen struck a considerable showing of ore, not sufficient to wholly run the furnace, but many tons will be smelted, and there is no doubt but developments will be made that will place this mine again in the first rank.

EUREKA CONSOLIDATED.—Same of the 25th: One of the new and two of the old furnaces are in full blast. The new one is the largest ever constructed for lead smelting in America; six and a half feet wide at the feed holes, and four and a half at the hoshes. During the first 18 hours 75 bars of 120 pounds each were ladled out.

DIAMOND DISTRICT.—Messrs. Elzy Paul and others, have opened a large ledge which they have named the Champion, and, parallel therewith, the Hidden Treasure and the Patriot. In all they have 15,000 feet through which ledge matter may be traced. They have two hundred tons ore on dump which assays on the average \$277 in silver and 72 per cent of lead. They will erect a 15-ton furnace for smelting.

STRIKE BY ACCIDENT.—Smith, foreman of the Empire, in making a road, struck chloride ore in front of the Regulator Co.'s ground, that assays \$191 per ton.

BIG RUN.—Same of 28th: Three of the furnaces of the Eureka Consolidated produced on Friday—24 hours—251 bars of bullion of 115 pounds each. This is the largest amount ever made in 24 hours by any three furnaces in America. The average value of the hullion is \$350 per ton.

HUMBOLDT.

RELIEF DISTRICT.—*Silver State*, May 27th: The Greenstone ledge, Hadley & Co., is worked with flattering prospects. The Co. have sunk a shaft 42 feet, having a ledge 32 inches in width, showing rich in black sulphurets and horn silver. One assay gave about \$3,000 per ton. It is believed that the entire vein will yield \$100 per ton.

BULLION.—The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$6,557.

RAILROAD DISTRICT.—*Elko Independent*, May 27th: Hussey & Co., of New York, have commenced operations upon the Lone, True and Red Jacket mines.

GALENA.—*Cor. of Register*, May 27th: Ore from the White mine has yielded as high as \$2,500 per ton in silver. Some 300 tons of ore showing \$390 per ton in silver and 30 to 50 per cent. lead, have been shipped from this place during the last 12 months. Different mines are producing and will produce for a long time to come, ore in large quantities worth \$60 to \$100 per ton. The Butte mine gave as its highest yield, from first class ore, \$801 per ton.

REESE RIVER.

GOOD ORE.—*Reveille*, 23d: A lot of 27 tons from the Monitor ledge, Belmont, has just been worked at the Manhattan mill, which surpasses in richness any previous lot brought here from Nye county. Six tons, set aside as first class, gave a pulp assay of \$1,241 per ton; the balance of 21 tons, designated as second class, assayed \$626 per ton.

QUARTERLY STATEMENT.—The *Reveille* gives these figures for the Lander county mines for the quarter ending March 31st: Total number of tons ore worked, 6,341. Total value, \$419,477.

WASHOE.

OPHIR MINE, NORTH.—*Enterprise*, May 26th: Evans & Berry, who own a mill on Cedar Ravine, have leased the old upper levels of the northern part of the Ophir for six months, and are making preliminary examinations, with a view to the extraction of ore. The part of the mine leased contains base metal ore, some of which is very rich, (we saw a small specimen, which will assay \$500 or \$600), but it will probably be found that but a small proportion of the silver can be saved by the common pan process.

LADY BRYAN.—Same of 28th: The mill is running steadily on ore from both the open cut and the 80-foot level. Frequent assays are made of the ores extracted. We have been shown a number of cortificates. The first dated May 17, shows \$26.40 to the ton; May 18, an assay of pulp from the battery showed \$102. An assay of a selected specimen showed \$1,104.38. The highest obtained was from a piece of ore which good judges considered worthless; the yield was at the rate of \$3,784.28 per ton. The average of 140 working assays made since the present owners have had charge, is \$31.82 per ton.

CHOLLAR-POTOSI.—During the past week there have been extracted 2,010 tons of ore, of which there have been sent to the mills 1,788 tons the average assay value of which was \$56.20. They yesterday shipped \$63,000 in hullion.

KENTUCK.—This mine is being put in good working order. The Co., are taking out 45 to 48 tons of ore per day, which assays \$49 per ton. Two mills—the Excelsior and Gold Hill Quartz—are being run on ore from the "hurmt district" between the 600 and 700-foot levels, which is being retimbered as the work progresses.

SEGREGATED BELCHER.—The Co., are prospecting toward the Belcher line. As yet they have found nothing. They are taking out but about ten tons of ore per day.

The Sierra Nevada mill is in constant operation on gravel from the old deposit in the company's mine.

SUTRO TUNNEL.—The Suto Tunnel is in 2,000 feet. The ground works well.

MAMMOTH.—*Carson Register* May 24th: Mr. Hooton, one of the locators, reports the mine looking better than ever. The Co. will have twenty tons of ore ready for shipment to Reno for reduction on Monday.

COMSTOCK No. 2.—Same of 27th: This is the lead recently opened on the south side of Carson river, midway between the Yellow Jacket mill and the Brunswick dam. The owners under the name of the Empire Co., are prospecting. A shaft has been sunk 63 feet, and a drift from the bottom is being run to cut the vein. Assays from ore at a depth of 40 feet show \$63 to the ton.

WHITE PINE.

REVIEW.—*News*, May 27th: About 120 tons of ore per day are transported by the tramway to the International mill. The South Aurora is shipping ore by teams to the Stanford mill. The O. H. Treasure is making preparations to commence shipping. Ex-Gov. Blasdel is prosecuting work with vigor on the Ward Beecher Consolidated. He will start the Manhattan mill next week, and increase the working force of the mine. The International mill has been running all week on low-grade ore, but has made no hullion shipments, owing to the fact that the assay office and apparatus had to be removed. In the mines on Chloride Flat, a great deal of work is being done and a large amount of ore extracted. Two mines—the Emersley

FOUR MONTHS' SUBSCRIPTION FOR \$1.—Subscribers to the PRESS who remit direct to this office \$5 coin, in advance, hereafter, will be credited four months over a year for the extra dollar received above our regular rates. This will render it both convenient and profitable to enclose a \$5 piece in a registered letter, in which case we will be responsible for its safety.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING MAY 16TH.

GEARING FOR OPERATING DRILLS.—Amrose Blatchly, San Francisco, Cal.

THRASHING-MACHINE.—John Foreman, Healdsburg, Cal.

DOVETAILING-MACHINE.—Elander Heath, San Francisco, Cal., assignor to S. W. Shaw, William E. Brown and Leonard Goss.

AMALGAMATING THE PRECIOUS METALS AND PREVENTING THE LOSS OF MERCURY.—Josiah S. Phillips, San Francisco, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency the following are worthy of notice.

ROLLER-SKATE.—P. B. Borein, San Leandro, Cal. With the laudable desire of rendering the exercise of skating as easy as possible, and to avoid the necessity of too violent exertions in its pursuit, that it may be at once healthy and enjoyable, Mr. Borein has invented a roller-skate which is worthy of notice. In this there is a novel device which renders possible the "cramping" or turning of the rollers without the necessity of canting the foot-stand or skate block. The invention includes the application of elastic blocks or springs, by which the skate is made to ride easily. It consists also in the particular application of the rubber or other elastic spring for returning the rollers to their parallelism after the weight is removed.

DIVISION PLATE FOR COOKING STOVES.—The object of this invention is to enable housekeepers to economize in fuel by diminishing the size of the fire-place, and it is intended more particularly for cooking stoves, while it is also applicable to all kinds of stoves. It consists in the employment of a plate of metal, made to fit the fire-place and top-chamber of the stove, which can be moved back and forward across the fire-place. When not required for its purpose, this plate or partition is kept close up against the side of the stove opposite the door, thus making a false back to the fire-place, or, in other words, a double side to the stove. When it is desired to use only two of the holes in the stove, the partition can be moved to the middle of the stove, so as to cut off one-half of the fire-place and draft, thus confining the heat to one side of the stove and requiring but little fuel for the production of the desired heat.

ORE CONCENTRATOR.—W. C. Styles, Nevada City, Cal. This invention relates to an improved device for concentrating sulphurets. A sluice box is suspended by swinging rods inside of a frame, and is swung by means of a cam and by springs in such a way that it gets a peculiar jarring motion. Teeth or stirrers of a certain construction are made to agitate the sand

which collects or banks up against a riffle in the sluice. The tailings are fed into the sluice continuously, and, by the action of the water, the jarring motion and the rakes, the sand is carried off over the riffle, while the heavier sulphurets are drawn in an opposite direction and up an incline, over which is placed a peculiar drip box. Water from this box washes off any sand, which may have accompanied the sulphurets, on the one side, and carries the sulphurets down an adjoining oppositely-inclined plane, on the other side.

Editorial Notes Eastward.—4.

Through Snow Sheds and Tunnels by Night.

A novel night-ride had I, from 9 to 11 P. M., as *third* engineer on the locomotive (forward driver) on the C. P. R. R., be-

tirely shutting off our "look-out" beyond our "cow-catcher," so that we seemed occasionally to plunge furiously through darkness a hundred times blacker than any "out-door" darkness imaginable.

I shall not soon forget the watchful sight tendered to the many quick curves, and the graceful windings in the solid and grand colonnades which we speedily traversed during a two hours "inside look-out" with our trustworthy driver,—a noble engineer, honest enough to say that he much preferred "out-door" running.

As to my own experience, I would say that a berth in the palace sleeping car in rear of the train is far more comfortable and healthy for a tender passenger than a

to their utmost extent—the thumb and little finger being much the longest—represent inlets indenting the south shore, and stretching inland, as if to wash away the Rocky Mountains. Between these inlets project high, rocky promontories, covered with dense timber. The largest stream flows into the lake at its upper end, or the extreme southeast corner. This stream is really the Yellowstone River, which, for a distance of thirty miles, has an average width of over fifteen miles. This enlargement constitutes the lake, which, after being augmented by several smaller streams, narrows down to the width of an eighth of a mile, and flows northward toward the great falls.

The mood of the lake is ever changing; the character of its shore is every varying. At one moment, it is placid and glassy as a calm summer's sea; at the next, "it breaks into dimples and laughs in the sun." Half an hour later, beneath a stormy sky, its waters may be broken and lashed into an angry and dangerous sea, like the short, choppy waves which rise in storms on Lake Erie and Lake Michigan. Where we first saw it, it had a glittering beach of gray and rock-crystal sand, but as we continued around it, we found rocky and muddy shores, gravel beaches—on which several varieties of chalcidony were profusely scattered—and hot springs in abundance. Near the southeast end of the lake is the highest peak in the vicinity. It is steep and barren, and from the lake-shore appears to taper to a point. On the south side is a precipice, nearly a thousand feet high. Two of the party ascended it. It took them all of one day to make the trip and return. About two-thirds of the way up they were obliged to leave their horses, and continue the ascent on foot.

The altitude of the mountain, as obtained by observations with the barometer and thermometer, was 11,163 feet. Much snow was found before reaching the summit. A fine view of the surrounding country and a good idea of the shape of the lake were obtained. Immense steam-jets were seen to the south; but as our time was becoming somewhat limited we did not remain to visit them. Several barometrical calculations were made, and we determined the height of the lake to be 8,300 feet.

NEW CATTLE CARS.—A train of eleven of Stuart's palace stock cars were loaded at St. Louis, on April 28th, with 170 steers, and left via the Indianapolis, Bellefontaine and Pennsylvania Central Railroads, direct for the Communipaw yards, New York. This is the first full train of these cars ever loaded, and the event is regarded by railroad and stock men as a very interesting one in the shipment of live stock. The cars were loaded in from 6½ to 10 minutes each, and will reach New York in 96 hours. The cattle will be fed and watered

in the transit. The old mode of shipment required 240 hours for the same distance. If this shipment prove successful, a company will be formed in St. Louis for building cars, and operating them on the roads west of there, to accommodate the great cattle trade of Texas and Kansas.—*U. S. Min. and R. R. Reg.*

AN INTERESTING DOCUMENT.—The most interesting document yet revealed by Mr. Kremer's researches among the archives in Los Angeles, is an original proclamation of peace between Mexico and the United States, made by the commandant either of the post or the department. It is in a mutilated state, lacking both date and signature.

RIPE BLACKBERRIES are making their appearance on the banks of the San Joaquin river, below Millerton.

SNOW COVERING.
329 miles from San Francisco—Altitude 5,354 feet.

SNOW GALLERY.
244 miles from San Francisco—Altitude 6,554 feet.

tween Cisco and Truckee, thirty-five miles, most of the track continuously leading through snow sheds and tunnels, including the noted Summit Tunnel, 1,659 feet long, and over 7,000 feet above the sea. The two locomotives, in tandem, with their fiery throats consuming a cord of wood each in less than a hundred minutes, constantly showering live sparks, and with reflecting head lights, effected a more brilliantly lighted interior than is wont to

front seat with the engineer—at night! A two weeks' severe cold and cough has relieved me of all locomotive hobbyism.

Yellowstone Lake, Wyoming.

Our Pacific Coast magazine, the *Overland*, comes to us for June with its usual pleasing variety. From its rich pages, overflowing with charms, we cull the following concerning a lake of which we

SUMMIT OF SIERRAS.

INTERIOR SNOW SHEDS.

be met with elsewhere in the "caverns of the earth."

At some places we could see a long distance forward, and I watched the huge, glistening icicles, pendant from the roof or crevices in the overhanging rock, with a feeling of certainty that "our smoke wagon" would strike some of them into a thousand fragments; and yet as we neared them, all seemed to "arise with the occasion," invariably dispelling our anticipated fun.

Sometimes the smoke of engines which had driven through before us, remained in the tunnel, and the grim cloud appeared to be driven and massed before us, en-

have all read so much and yet know so little.

Lake Yellowstone is a lonely, but lovely inland sea, everywhere surrounded by "forests primeval," and nestled in the bosom of the Rocky Mountains. Some trappers have insisted that its waters ran both to the Atlantic and the Pacific, but such is not the case. The summit of the chain, however, approaches within half a mile of its south shore, and in places the divide is very little above the lake. Its shape resembles the broad hand of an honest German, who has had his forefinger and the two adjoining shot off at the second joint, while fighting for glory and Emperor William. The palm of the hand represents the main body, or north part, of the lake. The fingers and thumb, spread

Santa Barbara as a Sanitarium.

ENRORS PRESS:—A considerable break having occurred in my weekly meteorological reports, in consequence of my absence from Sacramento, in search of a retreat for invalids, I propose filling up the gap with some account of the climate, topography and surroundings of this interesting region from a sanitary point of view. In doing so, I purpose confining my remarks chiefly to that portion of Santa Barbara which consists of a coastwise strip of land, averaging about three miles in width and some sixty or so in length, and extending in a due westerly course from Point Conception to Point Buenaventura. Bounded on the north by the Coast Range mountains, of an average height of 3,000 feet, which prove an insurmountable barrier to the peculiar harsh oceanic winds, and on the south by a channel formed by the Santa Cruz and other islands, some 20 miles distant, which serve as well to deflect the cold current that sweeps down from the Arctic seas as to afford protection from the concomitant cold fogs that roll in so uninterruptedly in other parts of the coast, this portion of California stands out pre-eminently the land of promise to the weary desponding invalid.

The very conformation and topography of this section, while it explains the cause, speaks to the intelligent reader of a climate that cannot be otherwise than even, mild and soft, and, at the same time, invigorating with the moist, but refreshing, sea breezes, which the thirsty land sucks in. In vain, heretofore, since my appointment to the responsible position of Health Officer to the State, have I sought for such a combination of sanitary qualities as are now presented. Here in this mountain and island locked valley, rising but a few feet from the blue waters of the grand old Pacific, all the pre-requisites of health are to be found in measure so profuse, that I would be accused of poetic extravagance, were they duly portrayed. The instrumental and numerical proofs must be left to sustain all I have advanced; but before stating these, which I can only now do in part, (reserving the fuller details for a State report,) I proceed to speak more particularly of the town proper, which furnishes the type of the whole region reviewed, and where the statistical and meteorological data have been carefully compiled by trustworthy observers.

Description of the Place.

Santa Barbara is the county seat and principal town of the county of the same name. It is built upon a beautiful slope, rising from the sea-beach, at the south-eastern extremity of a gently ascending valley, some fifteen miles in length and two in width, but gradually spreading out to five miles, as it extends into the interior. The beautiful harbor consists of a cove, or semi-ellipse, about one and a half miles wide from point to point, indented into the curving shore and protected by the overlapping San Rafael and adjoining ranges. The gently sloping beach for several miles affords safe sea-bathing at all seasons of the year. At low water an admirable and pleasing drive, equal to that of Newport, may here be had, and the interesting drawing of the seine, full of every variety of fishes, may be witnessed,—a most important item in the dietary of the feeble, from the warmth-giving phosphorus it contains.

The historical feature and nucleus of this old Mexican town, now in an active transition stage, is the old Mission Cathedral, about one mile and a half from the shore and at about 300 feet elevation from the sea level. It is built of sandstone of the surrounding hills, and one is struck with the ancient grandeur of its imposing Moorish style of architecture. The main nave of the building is 200 feet long and 40 feet wide, supporting two lofty domes in front, with belfries of solid masonry, which are seen at a great distance in all directions, both on land and ocean. To the left is a wing 130 feet long, with porches supported on pillars and arches, all in a good state of preservation. I call attention particularly to this monument of the zeal of the Franciscan Friars, who, in 1786, here first raised the emblem of the cross, because, in keeping now with this progressive age, these self-sacrificing fathers are strenuously conducting a flourishing college, which is making rapid strides in its course towards

the noble position which it is destined, at no very remote day, to occupy among the literary and scientific institutions of the country.

Among the works, stupendous for the times, constructed by the well ordered labor of 3,000 Indians attached to this mission, are reservoirs, basins, fountains and aqueducts, running over with pure spring water from the adjacent mountains. These, it is contemplated (as I am informed), to extend into the city, by a system of water works, and thus provide for one of the most essential elements of health.

Schools and Churches.

Besides the missionary system just noted for the education of boys, there are also the St. Vincent's College for girls, and the Santa Barbara (Protestant) for both sexes. In addition, there are two good public schools which are well attended. These institutions attest the intellectual basis on which the future prosperity of the city is to be built. The religious element, too, is not wanting, for there is a larger proportion of churches to the population than I have witnessed in any other California town, some of which are built in good architectural taste. Besides the old Mission, the Catholics have still another church in the town, and the Congregationalists, Episcopalians and Methodists have each a brick edifice. The Presbyterians have as yet only a small wooden chapel, but contemplate erecting a more imposing structure at an early day.

About one-third of the town consists of the primitive tile-roofed adobe houses, which, however, are fast disappearing before the encroachments of modern wood and brick buildings. A large three-story hotel is now in process of construction, which will be furnished with all the modern appliances necessary for the comfort of travelers.

In fact, nothing can now check the march of improvement, which, in the last three years, has advanced in a geometrical ratio, going on at the same rate towards building up this, the promised land, into a health resort, unsurpassed in artificial, as it is in natural, advantages by any place on the coast, the continent, or the world.

Were I writing from any other than a sanitary standpoint, I could dwell with rapture on the refined and cultivated society to be here met with, and of whose prodigal hospitality I have been the surprised recipient. I could also speak of gardens redolent with the perfume of every kind of flower, of tasteful cottages, and still more ornate residences, from which the sweet accord of music floats upon the balmy air, and of landscape views, which, for loveliness and variety, are rarely equalled. These meet one at every turn, and almost tempt me, while I write, to stray into the paths of descriptive romance. But I have taken up my pen to speak of facts—of climate and of vital statistics—and to those I must confine myself.

Agricultural Features.

I cannot, however, refrain from alluding to the prolific yield of the soil, which, as it depends upon a peculiar climatic feature, comes within my scope. I have seen for myself, and have conversed with producers from all parts of the world, and with them am satisfied that for richness and depth, varied productiveness and yield, the land has no superior. I have seen above Indian-cornfields, with the grain just germinating at this late date, when the rains are all over, and which, I am assured, will produce without irrigation from 100 to 150 bushels to the acre; and this in consequence of the absorbent properties of the soil from the moist sea air. Vegetables, with no exceptions, are readily produced in quantity and size that might challenge the credulity of an upper Californian. Every kind of tropical and other fruit grow to perfection, and the orange and the apple may be seen bearing fruit side by side. As a special proof of the prolific character of the soil, I will mention a grape-vine, some three or four miles out of the town, which, on actual measurement by myself, was found to be four feet three inches in circumference, 4½ feet from the ground, at the point of beginning of the first branch. This vine, still healthy and vigorous, was planted from a cutting some forty odd years ago, and its branches now spread over a trellis 76 feet long and 61 wide, which they completely cover. It produces from 12,000 to 15,000 pounds of fruit annually—some of the clusters weighing five pounds. I have seen large grape vines in France and other parts of the world, but this beats them all; and so said the great traveler, Mr Seward, when he measured it a year or so ago.

Mineral Features and Influences.

This must suffice to give some idea of the wonders of the vegetable kingdom. Let us now turn to the mineral, which, as will be shown in the sequel, even mingles with the air we breathe. About four miles from the town, picturesquely located in one of the cañons of the mountains, are the Hot Sulphur springs, which have become favorably known as a place of resort for invalids, especially those suffering from rheumatic affections.

I learn from good authority that while the country was subject to the Crown of Spain, the government sent out a commission of qualified scientific observers to make an examination and analysis of all mineral waters, both in Mexico and upon the Pacific Coast, and that this commission, after spending much time prosecuting their inquiries, reported the most favorably on the properties of these springs. The waters are found of different temperatures, varying from 60 to 130 degrees, Fahr.; but I would advise invalids resorting to them for relief not to indulge too long at first in their relaxing influence, as very often, patients, feeling themselves immediately improved by their use, are apt to resort to them too freely.

As to the climate of Santa Barbara, it will be seen that, although lying in about the same latitude as Charleston, S. C., yet it is totally different, and that the isothermal line would be deflected towards St. Augustine, Florida. The same clothing is worn all the year round, and there is no day in the year in which the invalid may not sit out of doors. This covers the most essential indication in the treatment of consumption, by affording a continuous supply of pure, unadulterated air-food for the lungs. Still, as the climate possesses some latent peculiarities in its favor, too subtle for ordinary observation, I shall instance the remarkable phenomena, so philosophically noted by Dr. Brinkerhoff, who has resided here 18 years.

Remarkable Phenomena.

"Some ten miles from Santa Barbara in a westerly direction, in the bed of the ocean, about one and a half miles from the shore, is an immense spring of petroleum, the product of which continually rises to the surface of the water and floats upon it over an area of many miles. This mineral oil may be seen any day from the deck of the steamers plying between here and San Francisco, or from the high banks along the shore, its many changing hues dancing upon the shifting waves of the sea, and affording various suggestions, both for the speculative and the speculator. Having read statements that, during the past few years, the authorities of Damascus and other plague-ridden cities of the East have resorted to the practice of introducing crude petroleum into the gutters of the streets to disinfect the air, and as a preventive of disease, which practice has been attended with the most favorable results, I throw out the suggestion, but without advancing any theory of my own, whether the prevailing westerly sea breezes, passing over this wide expanse of sea laden petroleum, may not take up from it and bear along with them to the places whither they go, some subtle power which serves as a disinfecting agent, and which may account for the infrequency of some of the diseases referred to, and possibly for the superior healthfulness of the climate of Santa Barbara."

I would add that during one week's sojourn here, my attention has been directed to the peculiar ambrosial influence pervading the air, so well described above, and that I indorse all that has been stated in this respect. That the climate of Santa Barbara possesses all the elements of general healthfulness in an eminent degree, is substantiated by the facts that the epidemics and diseases incident to childhood are almost unknown. Fevers and agues never originate here. Small pox, frequently brought from abroad, never spreads, although hundreds of the native population, either from ignorance or prejudice, never allow themselves to be vaccinated.

Temperatures and Moisture.

I have said when speaking of the prolific yield of the soil, that it was due to the moist sea air. On this depends the deliciousness of the climate. Moist air, either too hot or too cold, is injurious. The latter chills the surface and drives the blood in upon the internal organs. But the moist air in which we bathe in Santa Barbara is possessed, of that happy combination of temperature with moisture, which, while it refreshes, also invigorates and vitalizes equally the whole system. The range between the wet and dry bulb thermometers, at 2 p. m., is usually about four degrees, except on foggy or rainy days,

when it is sometimes identical; and yet, strange to say, the feeling of chilliness is never experienced. During the prevalence of a high land wind, the range is occasionally extended to ten or even twenty degrees; but even then that feeling of irritation and dryness, which attends the same wind in the more northern portions of California, is unknown. This occurrence, however, does not happen oftener than once or twice a year, and then only for a brief period about the equinoxes.

The peculiar evenness of the climate is shown in the following tables, compiled from the meteorological register of the Rev. J. A. Johnson, the "indefatigable editor of the Santa Barbara Press."

Vital Statistics.

To the labors of Drs. Bates, Biggs, and Father Villa, I am indebted for the following table of the vital statistics of Santa Barbara, compiled from the records of the Mission, during a period extending over nearly ninety years.

Date.	No. of From April 21, 1782, to Dec. 31st, 1800.	No. of deaths.	No. of marriages.
1782-10	213	80	40
1800-10	165	63	31
1810-20	206	74	33
1820-30	306	78	57
1830-40	622	133	69
1840-50	635	193	116
1850-60	956	405	172
1860-70	1087	495	172
Total	4090	1620	707

It will be seen from the above that for each death there have been 2½ births,—an unusually large proportion as compared with other places. Another point of interest is the marked increase of the death ratio during the last 20 years; due doubtless to the advent of adventurers and invalids. In addition to long life, these statistics show that to each marriage there is an average of about 5½ children, an unprecedentedly large proportion.

The following statistics of the town and county of Santa Barbara are taken from the U. S. Census Returns for this county for the year ending June 1, 1870, and speak more for the healthfulness of the place than anything I can add.

Population of the town, 2,987. Number of births, 131; deaths of children under one year of age, 9; ratio of births to deaths, 14½ to 1. Total number of deaths, including adults, for same period, 23; ratio of births to deaths for the whole population, 5.7 to 1, or nearly 6 to 1. Percentage of deaths in the town population, 1 in 130, or .77 of 1 per cent.

Population of the county, 7,984. Number of births, same period, 235; total number deaths of children under one year of age, 15; ratio of births to deaths, 15½ to 1, or nearly 16 to 1. Total number of deaths in the county, 64, two accidental; percentage of deaths in total population, 1 in 125, or .80 of 1 per cent.

THOMAS M. LOGAN, M. D.,
Permanent Sec'y. State Board of Health.
Santa Barbara, May 22d, 1871.

THE RAILROAD IN SONOMA.—The Santa Rosa Democrat, of May 27th, says: The railroad has now been completed to Russian River, within a very short distance of our beautiful sister town of Healdsburg. It seems to be the opinion of most people that the company will not bridge the river this summer. Should this be the case, it is difficult to tell when the Directors will resume the work of pushing the road on to Cloverdale. As things now stand, Healdsburg will receive as much benefit, if not more, than any other town in the county from the construction of this road, and we are far from being envious of her good fortune. Although the road will terminate where it is for the present, our Cloverdale friends can rest assured it will reach them in the course of time,

Interesting to Settlers.

The Commissioner of the General Land Office has issued a circular explaining the effect of recent legislation by Congress upon the interests of settlers on the public lands. With respect to "offered lands," filing within thirty days and payment within twelve months after settlement are still required:

"The settler on surveyed 'unoffered land' must file his or her declaratory statement within three months from the date of his or her settlement on such land, and within thirty months from the expiration of said three months, make the proper proof, and pay for such land.

"Where settlers have already filed before the passage of the Act, [of July 14, 1870,] they are required to make proof and payment within two years from such passage; therefore, all filings made prior to that date will expire, by limitation of law, upon unoffered lands, on the 14th of July, 1872.

"The settler on 'unsurveyed land' must file his or her declaratory statement within three months from the date of the receipt, at the District Land Office, of the approved plat of township embracing the tract upon which he or she is settled, and, within thirty months from the expiration of said three months, make the proper proof, and pay for such tract.

"The proviso of the Act of June 2, 1862, requiring filing within six months from survey in the field, and providing for filing with the Surveyor-General, is repealed."

It will be seen that those who filed on unoffered land prior to July 14, 1870, have till July 14, 1872, to make proof and payment; while those who filed on unsurveyed land after the former date have thirty months from the expiration of three months after filing of map.

PENNSYLVANIA MINING CATASTROPHE.—Details of the late coal mine horror, at Pittston, Pennsylvania, have been received, by which it appears that of the thirty-eight men in the mine when the one shaft caught fire, twenty were saved. The miners above acted, as they always do, most gallantly in their endeavors to save those below. In addition to this catastrophe, comes the news of an explosion of 400 lbs. of nitro-glycerine, near Titusville, Pa., by which, however, only one life was lost.

Improvements in Amalgamation.

The *Territorial Enterprise*, about a month ago, had a very interesting article on working tailings at Washoe. It gave a detailed history of how the attention of millmen there was gradually attracted more and more to the possibility and the profit of catching and treating the slimes and tailings, and spoke of the processes of the mills employed in amalgamating these.

As the paper remarked, the tailings and more particularly the elimes (or the ore which floats away from the battery and out through the settling tanks in the mill, thus escaping all metallurgical treatment) are very hard to collect. Being in a finely divided state, they are easily floated off on the water; and hence, although much is caught in the extensive sluices and reservoirs, yet, after miles of these, the water still holds a large quantity in suspension.

The reason of this is to be sought in the nature of the soft clay which occurs in the Comstock lode, which nature is best expressed to the miner by the name of "elime." This forms a light mud, and very likely the decomposition of the sulphurets aids in its escape, by the formation of bubbles which adhere to the slimes. Such material is very difficult to amalgamate. As the *Enterprise* says, the Parke & Bowie mill finds it profitable to catch and save their own tailings—the tailings of tailings, the slimes of elimes. In amalgamating them, "the dose of salt and sulphate of copper is made much stronger than for tailing alone."

To this last sentence we call particular attention. It is to the use of chemicals, at least, to a very great extent, in the pan that we must look for improvement in the amalgamating process. We have often seen an amalgamator put a spoonful of sulphate of copper into a large pan in the belief that he was effecting something thereby. This was of course absurd. Instead of spoonfuls he should have put in pounds. It is the use of salt and the sulphate of copper in large enough amounts that enables the tailing mills, added to above, to return a large percentage of the silver and thus be run at a profit.

The chemical dose can be given in treating silver ore in very many instances with great advantage. It will raise the yield to a very perceptible extent. But it must be used judiciously, reference being had to the amount of metal in, and the nature of, the ore. In some cases, of course, it will be needless. But it can very often be employed with profit, if employed with judgment.

There are some drawbacks to this. The bullion will not be so pretty, for the copper will go into it to a great extent, and the chemicals will attack the pan. But the increased yield will repay for all this. And in time the addition or substitution of other chemicals, and improved constructions, will decrease the bad effects.

A New Construction.

We learn from the paper, on whose article we have been commenting, that Mr. Parke, one of the proprietors of the Parke & Bowie mill, has a new pan in use for working tailings. As we have lately seen, at the Union Foundry in this city, a pan of new construction, we take this opportunity of describing it.

The pan is not claimed to be of particularly or completely novel construction, but is rather a combination of such points as have been shown to be desirable by practice. The chief object is to provide a pan which can be easily cast, easily transported, and easily repaired, when damaged in any one part, without the necessity of throwing away the whole thing.

The flat bottom is cast with iron sides, 15 inches high. To protect these sides, which are particularly exposed to wear and tear and to the action of the chemicals, an

iron ring, 10 in. high, 1 in. thick, is placed in the pan, resting on the bottom and fitting exactly to the sides. The iron sides are surrounded by wooden sides of the height (30 inches) of the pan, leaving in metal, and exposing less iron to precipitate the copper from its sulphate. The wooden sides are held by three enclosing iron hoops, the ends of each of which are connected by tightening screws.

The discharge hole is on a level with the bottom of the pan, so that it can not well stop up, or, if it does, can be easily cleared. The iron ring, referred to above, is so constructed that, when worn out at the bottom, it can be reversed.

The shoes, dies, mullers, cone, driver, all the various parts, in short, are cast separately and fastened in the simplest manner. The cone rises some 9 inches above the top of the pan, so that no pulp can be elashed up to interfere with the working of the vertical shaft in the box or at the step. The flat muller-plate is cast with a socket, into which is locked, by a partial revolution, the corresponding lug on the foot of the driver. There is quite a large space allowed between the driver and the cone, preventing any packing of the ore between the two and allowing a free circulation of the pulp in the intervening space. There is a distance of 2½ inches allowed between the muller-plates and the interior ring; also a larger space than usual between the shoes. This is done to prevent packing of the ore, which experience shows is very apt to occur in working, in these spaces.

The vertical shaft, with attachments, can be raised or lowered four inches, to allow of setting the muller-plates, regulating the grinding, etc. The pan is 5 feet in diameter in the clear, and will work charge of about 3,700 pounds.

There are several other points of note, but sufficient has been said to intimate the general plan of the pan. By this construction, whenever one part is injured, this part can be easily replaced, being duplicated, without losing a large portion, or the whole, of the pan. By it, transportation is rendered more easy. There is also a saving of weight, although the bottom is made much thicker than common, this weighing some 1,200 lbs. less than the ordinary pan of the same size. The chemicals are also better utilized. The apparatus is, designed more particularly for working raw ore, where a large amount of chemicals is used. The Union Foundry has shipped a number of these pans to the Meadow Valley mill, Pioche, Nevada; to the Monte Cristo mill, Nevada; and to the Monitor and North Western mill, Alpine County, Cal.

The Diamond Drill at the Smartsville Tunnel.

In the *SCIENTIFIC PRESS*, of March 11th, 1871, we gave an accurate description of a new tunneling machine constructed by Messrs. Severance, Holt & Co., in this city for the tunnel of the Blue Gravel company at Smartsville. To have judged of the merits of the machine from its very first workings and before the workmen had had opportunity to understand its operation, would have been wrong, and we have allowed some time to elapse without taking particular steps to enquire into the details of the work, keeping informed, however, as to its general conduct.

A fair space of time having now elapsed, we have investigated the matter more fully, and can now give the results, which are eminently satisfactory,—so much so that a high testimonial (which we append) has been written by the Blue Gravel company.

The tunnel in question is to be 1,563 feet long, 8 feet high and 6 feet wide. Already 1,285 feet have been cut by hand, in three years, at a cost of \$40,000. Eight men were employed in the work daily,

making about one foot per day at a cost of about \$40 per foot, blasting with black powder.

The diamond drill machine has now cut 50 feet, with the aid of two men in the tunnel to operate it. The motive power is compressed air, supplied from a 15 horse-power engine at the mouth of the tunnel. The bore-holes are 1½ inches in diameter and 30 to 50 inches deep. Giant powder is used, being fired by an electric fuse and battery.

During a space of 4½ days, accurate observations and estimates of cost, work done, etc., were made. During this time, 11 feet 6 inches of tunnel were cut through the hard syenite bed rock, running out the debris 1,520 feet from the face of the tunnel. In this work, 7 runs were made with the drill (and 7 blasts), 8 to 13 holes being bored at each run, and 72 holes being driven in all. These holes varied in depth from 2½ to 4½ feet.

To make one foot of tunnel 6½x9½ feet, by hand drilling as before done, required about 30 holes, or from 300 to 330 holes for the lineal distance of 11½ feet, while with the diamond drill and giant powder, only 72 holes were required. During the last 40 feet, not a hole was drilled by hand, nor a steel drill used.

During the 108 hours (4½ days) named, 50 hours were consumed in running out the rock, leaving 58 hours for boring, traveling to and from meals, etc., etc. The average rate of boring, therefore, was nearly 2.4 inches per hour; or, of boring, running out rock, etc., nearly 1.3 inches per hour. Or, the tunnel was run in at the rate of 2.6 feet per day, while before only 1 foot was made.

The electric fuses and battery were furnished by the Electrical Construction and Maintenance Co., of San Francisco. The battery was placed about 800 feet from the face of the tunnel in a convenient place, and the charges were exploded without a single failure.

One great advantage found by blasting by electricity was that while 10 to 20 holes of giant powder were fired simultaneously, and while the effect was greater than where a powder fuse was used, the offensive smell was much less. This last is agreed to by all the workmen. With the electric fuse but little or no difficulty was experienced in this respect. It is thought that the offensive odor is caused by the combinations formed by the combustion of the black powder and nitro-glycerine.

The cost of running the 11½ feet of tunnel, including oil, wood and all other expense, excepting the interest on the cost of the machine, amounted to \$24.01 per foot, being about three-quarters of the cost of hand labor, while the work progressed nearly three times as fast. It is thought that these expenses can be reduced still further. The saving of time by the speedier completion of the tunnel, effects an important item in the economy of the enterprise.

The use of compressed air is a valuable auxiliary in keeping the tunnel in a proper condition for the health of the workmen.

Mr. Severance deserves the highest credit for his energy in introducing his machine and his talent in adapting it to the peculiar wants of the mining community. And to Mr. — Robineon, whose mechanical skill and practical good sense have been of the greatest aid, large credit must likewise be awarded.

What the mining company thinks of the machine in question will appear from the following letter, which we copy from the original manuscript, dated San Francisco, May 29th, 1871.

"We are pleased to express our high appreciation of the 'Diamond Pointed Tunnel Drill,' which we are using in our bed-rock tunnel at Smartsville, and pronounce it a complete success.

"With this machine more than twice the amount of tunnel is made per week, and at a less cost per foot, as compared with the hand drilling process.

"The best assurance we can give of our entire satisfaction regarding the working of it thus far, and its advantages over hand drilling in our hard syenite rocks, is the fact that we have purchased the one now in our tunnel and ordered from Messrs. Severance, Holt & Co. another of the same kind."

[Signed] Blue Gravel Min'g Co.
per JAS. P. PREROE.

A Refuge for Invalids.

The ill effects of indiscriminate praise are well illustrated in the case of the climate of California. It has been only too common for us to extol the excellence of the climate of any part of our coast. The result has been that visitors from other countries have come hither, have visited several localities which have been extravagantly puffed, have found that false statements have been made with regard to these places, and have been confirmed in the opinion that, as some of the most highly landed localities are absolutely unfitted for the purposes for which they are extolled, therefore California has no climate at all.

This opinion is now only too general abroad, and it is of the highest importance that the false impression should be corrected by careful, well authenticated statements of the actual facts of the case. That many places are unfit for invalids must be acknowledged. Our climate is generally salubrious, generally excellent for healthy persons. And we have also places most beneficial for invalids.

But where shall the sufferers go? This question can be best answered by our medical authorities. We call attention to the article (on another page) on Santa Barbara as a Sanitarium, which has been written by one of the most eminent physicians of the coast. For consumptives, and those suffering under chronic diseases, we have here a refuge vouched for by good authority. The sanitary advantages are well set forth by an impartial pen, and actual facts are given.

We hope to give equally correct facts of the kind with regard to other localities. We wish to show that California affords many a refuge for the sick, and that in its wide range of climate, it has conditions most especially fitted to cure. But these conditions do not exist everywhere, nor are they everywhere equally good for all cases.

Dry Concentration.

The Colorado Miner thinks that the Krom concentrator has proved a great success at the Washington mill, Georgetown, Colorado. At first, considerable difficulty was experienced in working the machine, but now everything goes smoothly.

The Miner has obtained the results of working a lot of ore from the Terrible lode, and gives figures as to cost and yield with and without dry concentration. We condense.

The amount of ore treated was 423 tons as received from the mine, which gave 407½ tons when dried. It assayed \$54.22 per ton in silver. The results from treating the concentrated ore were as follows:

Cost of hauling to mill and concentration.....	\$3,595.50
Loss on 22½ tons tailings @ \$3.91.....	877.35
Hauling concentrated ore to Reduction Works.....	178.00
Cost of reduction and loss therein.....	7,933.81
	\$12,604.66

Value of crude ore.....	\$22,094.65
Net gain.....	\$9,489.99

The cost without previous concentration is estimated as follows. The reduction works return 80 per cent. of the value and charge \$25 per ton.

Hauling to mill @ \$3 per ton.....	\$1,269.00
Cost of reduction.....	10,187.50
Loss by Amalgamation.....	4,418.93
	\$15,875.43

Value of crude ore.....	\$22,094.65
Net gain.....	\$6,219.22

This shows a gain of \$3,270.77 (\$8.02 per ton), by the use of concentrating machinery.

WASTAGE OF THE PRECIOUS METALS.—We call attention to an article, on another page, on this subject, written by Mr. Almarin B. Paul. The matter absolutely demands serious consideration. There has always been the greatest difficulty in getting actual facts in this connection, although we have all known that there has been a great loss. The article is therefore most interesting as well as most important.

Rotig's Patent Stop Watch.

From our most valuable cotemporary, the *American Artisan*, from whose pages we make liberal extracts, we take the following illustration and description of an improvement in stop watches. In the engraving Fig. 1 is a back view of the stop-seconds mechanism; Fig. 2, a front face view, the hour and minute hands being omitted; and Figs. 3 and 4, detail views of the mechanism.

The front end of the centre spindle, *c*, carrying the stop seconds-hand, *v*, is held in place under the dial by a small fixed bridge, *i*, the back end of which is supported in a small cock, *d*, capable of a slight oscillating movement on a pin, *k*, screwed into the back-plate, *m*, the cock being outside of the latter. The bridge, *i*, also carries the minute and hour wheels and hands.

On *c*, just inside of the cock, *d*, is secured a small, rough-edged ruby disk, *b*, the diameter of which may be equal to that of the ordinary seconds-pinion; and on the pinion staff of the "third wheel" is a smooth-edged disk, *a*, the diameter of which may be equal to that of the "third wheel." Attached to *m* is a thin steel spring, *e*, pressing against *d* with sufficient force to keep *b* in close enough contact

with *a* to enable the latter to give rotary motion to the disk, *b*, and the stop seconds-hand, *v*.

The stop lever is shown at *g*, and is arranged to work on a stationary fulcrum-pin, *n*. One end of this lever projects through the rim of the watch-case, as in Fig. 2, and the other end carries a vertical spring, *h*, the extremity of which protrudes through a small opening, *x*, (Fig. 1) in the back plate, *m*, sufficiently to press against the outer end of the cock, *d*. By pressing the protruding end of the stop-lever, *g*, in one direction, the vertical spring is removed from contact with the cock, *d*, and the pressure of the spring, *e*, is made to press the ruby disk, *b*, in contact with the disk, *a*, and the stop seconds-hand is thereby caused to start instantaneously, and afterwards allowed to operate freely.

By pressing the protruding end of the stop-lever in the opposite direction, the vertical spring, *h*, is made to press upon and so displace the cock, *d*, that *b* is brought out of contact with *a*, and the stop seconds-hand then stops instantaneously, its movement being prevented by the friction of a small spring, *f*, (Fig. 1 and 3) which presses against the center axis or spindle, *c*.

COLORING FOR BUTTER.—A French chemist announces the discovery of "carotine," the coloring principle of carrots which is invaluable to give butter the true Orange country tinge.

Apparatus for Preventing Boiler Explosions.

The apparatus herewith illustrated, termed an "explosicauter" by *La Propagation Industrielle*, from which the engraving is taken, embodies the application of the theory, held by Messrs. Dufour and Kaynen, that irregular ebullition is a fruitful cause of explosion in steam generators; this irregularity proceeding from excessive production of steam at one part of the boiler and the little or no production of steam at another. Primarily, this results from the immobility of the water in the boiler; and the object of the apparatus represented in the cut is to secure the agitation or circulation of the water. This is done by raising a portion of the same within the boiler and then letting it fall again.

A pipe, *a*, has at its lower end a curved portion plunged below the water level, while the upper part, extended above the boiler, terminates in a chamber containing a plunger, *b*. This plunger is suspended from a lever, *c*, which in part is held in equilibrium by a counterweight, *d*. Within the previously named chamber, *c*, is also arranged another lever, *f*, provided with the counterweight, *g*, and in gear or

connection with a pawl, *h*. Upon the chamber is arranged the valve and valve-chest, *k*, and also the valve at *l*, capable of being operated by hand. The space above the valve, *k*, communicates by a small tube, *m*, with the steam space of the boiler. By working the valve, *l*, the water in the boiler is caused to rise in the pipe, *a*, which consequently lifts the plunger, *b*. This movement of the plunger, acting through the pawl, *h*, actuates the lever, *f*, to lift the valve, *k*. This admits steam from the boiler into the chamber, which of course forces the water into the pipe, *a*, downward into the boiler. This done, the plunger, *b*, resumes its original position; the valve, *k*, comes back to its seat; and the pawl, *h*, is brought into such relation with the lever, *f*, as to repeat its action thereon when the plunger is again moved upward. The repetition of this proceeding, by the successive manipulations of the valve, *l*, to the desired extent, produces the requisite agitation of water in the boiler. The intermittent admission of steam above the valve, *k*, is controlled by another valve in the pipe, *m*, similar to the one, *l*, by which the chamber is in like manner intermittently made to communicate with the atmosphere. The two valves last mentioned permit the working parts of the apparatus to be isolated

from the boiler for repairs, etc., without interfering with the use, at the same time, of the boiler itself.

The advantages claimed for the means of insuring quasi-circulation or agitation of the water are as follows:—It will operate under great pressures; independent of the degrees of pressure; the extent of the agitation can be definitely and readily adjusted or controlled.

The quantity of steam lost in the use of the apparatus is very small, inasmuch as it is frequently sufficient if the rise and fall of water in the pipe is not oftener than three or four times per minute. It may, however, be operated when desired to the extent of fifteen times per minute.

The California Silk Manufacturing Company.

Those who have hesitated heretofore to buy stock in this company, being desirous of first seeing the factory of the company equipped with machinery, would do well to take a run out to South Francisco on the street cars, and examine the prospects for themselves. The new manager, Mr. James Leigh, who has but recently arrived from the East, has been engaged now during the last two weeks in placing the machinery in position. Everything necessary to the skillful and successful working of the factory depending upon the operative superintendent, the company are certainly fortunate in having secured the services of Mr. Leigh who resigned a lucrative position as manager of the Singer Sewing Machine Silk Factory at the East. With a reliable President, Secretary, and Treasurer, and an efficient Board of Trustees, this company, after emerging from the difficulties which invariably beset all new enterprises, may be found establishing itself as the foundation of a fortune to several and a means of competence to many.

We opine that many years will not elapse before several rival Silk Manufactories will have sprung up in San Francisco, and at several other portions of the State. The experience of the silk trade throughout the world is one of unquestioned profit to the owners of the stock. We cordially recommend this progressive enterprise to the patronage of our friends, who, to increase its efficiency, should liberally purchase in the company. The capacity of the California Silk Factory is rated at a consumption of 500 pounds of raw silk per week, or 25,000 pounds per annum.

IN GOOD COMPANY.—The New York Tribune alludes to the recent whereabouts of our straying partner in its reports of the N. Y. Farmers Club meeting, May 16th, in the following extract:—The President announced the presence of Mr. Dewey of the Pacific coast, and gave him opportunity to speak for the favored land. Mr. Dewey, in some graceful remarks, alluded to the fact that he, like many others in California, had long read and received benefits from the reports of the club proceedings, and that it was great pleasure to him to be present and get the matter in all its freshness. "It is an agreeable thought," he continued, "that I see here the parent of a similar institution to be founded on the Pacific slope. I remember that some of you, last summer, were impressed with the importance of a first-class agricultural journal for our States, and so urged. That hint has been acted upon, and we have a *Pacific Rural*, that is received with great favor by our farmers. Our climate, soils, seasons, and fruits are so different from yours that, while we can take your teachings as a general guide, we need instructions more precisely calculated for our people and their wants.

SAN FRANCISCO BOILER WORKS.—This new establishment has been instituted by Mr. F. I. Curry, who has started work at 123 and 125 Beale street, between Mission and Howard. Mr. Curry is sole manufacturer of the celebrated "spiral boilers." Having been for some years past foreman of the Vulcan Iron Works, and thus having gained valuable business experience, in addition to his mechanical skill, Mr. Curry feels that he will be able to satisfy his patrons both in regard to the quality of the work done at his place and in the manner of transacting his business affairs. We wish him success.

DOMESTIC ECONOMY.

Chemistry of the Kitchen.

How to Make Soup.

The ordinary dish of soup is an article of diet which is entirely dependent upon boiling for its cooking. Simply bringing the ingredients to a boil, as practiced by many, does not make a soup, but results in a mess, which no one can eat with satisfaction, and has caused a general dislike to soups which, when properly prepared, are the simplest, cheapest, most wholesome, nutritive and delightful article of food. Long protracted boiling is almost as great an evil as the first mentioned one. We will first examine the evils resulting from the foregoing false method of cooking soups, and then proceed to discuss a simple but more rational method.

1st. When soup is not sufficiently hoiled, the meat generally used, being such as is not available for other methods of cooking, remains tough and unpalatable, the liquid watery and insipid, and vegetables raw, hard and uncooked in the center. This mess of stringy meat, greasy water and uncooked vegetables is put before us as soup, and frequently to add to one's disgust, the meat and vegetables by being cooked over too violent a fire, are scorched, imparting a flavor of burnt feather to the loathsome mess.

2d. Let us examine for a moment the compound that has been "well hoiled." Upon entering the house we smell it, for in its long boiling, the steam has carried off out of the pot all the flavor of the meat

and vegetables. Of this we are fully convinced when we sit down to eat, and find we have before us a liquid in which our eyes tell us there are meat and vegetables, but our palates decline to sanction what the eye has seen.

The proper method to prepare soup is, in the first place, having put some water into a pot, add the meat, then place the pot in such a position that it will be kept at a "gentle boil," covering the pot with a pan, such as an ordinary small milk pan, as shown in the accompanying illustration; but of such a size that it will sit down about half way into the pot. The pan must be kept nearly full of water. By this arrangement the steam rising from the boiling soup is surcharged with the volatile flavors of the ingredients, but in place of escaping into the house it comes in contact with the bottom of the tin pan, containing the water, to which it renders up its heat, thereby being condensed and dropping back into the soup. This action will continue for an almost unlimited period, provided the tin pan be replenished with water at such times as it may be required; by this process, not only is the flavor retained in the soup, but the odor is not allowed to escape into the house, and by long boiling, all the skin, tendons, ligaments, etc., which the meats contain, are converted into soluble gelatine, acting as a thickening to the soup, and all of the kreatine (or ozmazone), which is the most valuable portion of the meat, is extracted therefrom, and retained for use. In other methods of cooking, this valuable kreatine is partially decomposed and expelled.

After the meats have been hoiled until all the "gristle" has been decomposed, the excess of grease floating upon the surface can be removed; then add such vegetables as desired, unless the soup is not to be used on the day it is cooked, in which case it can be set aside in a cool place until required. Frequent reheating the "soup stock" is rather advantageous than otherwise, pro-

vided the precaution be taken to use the tinpan with water to preserve the flavor, and such a moderate heat employed as to avoid scorching.

The French, who are the most economical of cooks, use in their soups all the gristle, etc., which they carefully cut from and out of their chops, cutlets, beef steaks, etc., thereby greatly improving their chops, etc; they also add all the bones, from which large quantities of nutritious matter are extracted by the prolonged boiling. Meats that have been over-roasted, etc., will not make good soup, as all the more valuable portions have been either decomposed or expelled.

There is frequently served up (especially at hotels) an article rendered as pungent as possible, and termed soup; to this we protest, as the compound is only an appetizer, and should be classed with hitters, curry, absinth, etc., etc. From what has been said, the value of soups may be stated as follows:

1st. Cheap meats that can be used no other way, on account of tendons, become more valuable than "choice cuts."

2d. Scraps, trimmings and bones become serviceable in lieu of being put into the garbage box.

3d. No portion of the nutritious ingredients is lost by cooking.

4th. Soups are readily digestible, are acceptable to the stomach, and

5th. Are remarkably economical for reasons stated in paragraphs 1, 2 and 3.

How to SWEEP THE FLOOR.—In the days of our Puritan grandmothers, no girl was considered fit to receive proposals of marriage till she could make a good hemlock broom; to know how to make a broom in those old days, we presume, was always preceded by the knowledge of its use. But in these later times, many a young lady not only offers herself in the matrimonial market, but absolutely gets married and undertakes to manage her house without knowing how to use a broom that some one else has made. It requires some science, or at least some skill, to use a broom well, as it does to do anything else.

To use a broom skillfully, the handle should incline forward and not backward, as is often the case. If the top of the broom inclines forward beyond the part next the floor, it will prevent much of the dust from rising into the air, and will carry it along by a gently sliding motion towards the place where it is to be disposed of.

If, on the other hand, the handle of the broom inclines backwards, the dust is sent into the air by a kind of a jerk, to the great annoyance of those who occupy the room, and to the great detriment of everything the apartment contains. More than this, it wears off the threads of the carpet quicker, injures the paint more, if the room is uncarpeted, and destroys the broom sooner, than if the sweeping was done in a more rational way.

How CHINESE COOK RICE.—The editor of the *American Grocer* has recently paid a visit to the Chinese shoemakers at North Adams, and has obtained from them the Chinese method of cooking rice. Their plan for boiling a pound of rice is:

"Take a clean stewpan with a close-fitting top, then take a clean piece of white muslin large enough to cover over the pan and hang down inside nearly to, but not in contact with, the bottom. Into the sack so formed place the rice, pour over it two cupfuls of water, and put on the stewpan, so as to hold up the muslin bag inside, and fit tight all round. Place the pan on a slow fire, and the steam generated from the water will cook the rice. Each grain, it is stated, will come out of the boiler as dry and distinct as if just taken from the hull. More water may be poured into the pan if necessary, but only sufficient to keep up the steam till the rice is cooked. The pan must not be heated so hot as to cause the steam to blow off the lid."

The same effect can doubtless be obtained by using a steamer such as may be found in any well-ordered kitchen.

TALKING AT THE TABLE.—"Is it proper to talk at the table?" By all means. We are aware that some few consider it proper to observe perfect silence while at the table. We do not know how such a horrid custom originated, yet we have a few times been a guest at such tables, but hope never to be again. The table is just the place to talk, and the meal hours should be amongst the pleasantest of the day. Don't talk business and discuss what work shall be done after dinner, but give the time to social chat. This should not prolong the meal inconveniently, but there should be enough of it to prevent the common custom of rapid eating.

Domestic Receipts.

How to SELECT A GOOD SILK.—A piece of good silk should possess three particular requisites—it should be soft, smooth and lustrous. The softer it is the better, provided it is close woven and not flimsy. The best way to determine its softness is to gather it in folds across its width, and observe its appearance. If it be good the folds will be round and soft in outline, like a piece of nice fine flannel; but if it be poor and stiff the folds will present sharp angles and points. Such silk, when made up, will always present angular folds and sharp projections, by which the fibres are easily broken. We all know the difference between the wear of anything with sharp, angular surfaces, and one with rounded, graceful projections. We have said it should also be smooth. This may be tested by any one of delicate touch, by passing the fabric between the thumb and fore finger, when any imperfection or roughness will be readily perceived. One of the chief characteristics of silk is its brilliant gloss—the absence of which is a sure sign of inferiority. A fictitious gloss is sometimes imparted to silk; but that can generally be distinguished from the genuine luster.

To CLEAN AND RENOVATE KID GLOVES.—Make a thick mucilage by boiling a handful of flaxseed; add a little dissolved soap; then, when the mixture cools, with a piece of white flannel wipe the gloves, previously fitted to the hand; use only enough of the cleanser to take off the dirt, without wetting through the glove.

To COOK A SHOULDER OF MUTTON.—Bone the larger half of your shoulder, lard the inside with well seasoned larding, tie it up in the shape of a balloon, lay some slips of bacon in your pan, and upon them place your meat, with 3 or 4 carrots, 5 small onions, 3 cloves, 2 bay leaves, thyme, and the bones that have been taken out; moisten with bouillon, set all on the fire, and simmer for three hours and a half; garnish with small onions.

Mechanical Hints.

To MAKE A SUPERIOR SAND PAPER.—Take a quantity of broken window glass (that which has rather a green appearance on the edge is best;) pound it in an iron mortar; then have two or three sieves, of different degrees of fineness, ready for use when wanted. Take any good tough paper (fine cartridge is the best;) level the knobs and lumps on both sides with pumice-stone; tack it at each corner on a board, and with good clear glue, diluted with about one-third more water than is used generally for wood work, go quickly over the paper, taking care to spread it even with your brush; then, having your sieve ready, sift the pounded glass over it lightly, yet so as to cover it in every part; let it remain till the glue is set, take it from the board, shake off the superfluous glass into the sieve, and hang it in the shade to dry. In two or three days, it will be fit for use.

The paper will be much better than any you can buy—and being frequently mixed with the glass, and colored to deceive the purchaser.

To CLEAN SOFT MAHOGANY, OR OTHER POROUS WOOD.—After scraping and sand-papering in the usual manner, take a sponge and wet the surface to raise the grain; then with a piece of fine pumice-stone, cut the way of the fibres, rub the wood in the direction of the grain, keeping it moist with water. Let the work dry; then, if you wet it again, you will find the grain much smoother, and it will not raise so much. Repeat the process, and you will find the surface perfectly smooth, and the wood much hardened. By this means common soft Honduras mahogany will take a polish equal to fine Hispaniola.

ANOTHER WAY TO CLEAN, AND FINISH MAHOGANY WOOD.—Scrape and sand paper your work as smooth as possible; go over every part with a brush dipped in furniture oil, and let it remain all night; have ready the powder of the finest red brick, which tie up in a cotton stocking and sift equally over the work the next morning, and, with a leaden or iron weight in a piece of carpet, rub your work well the way of the grain, backwards and forwards, till it has a good gloss. If not sufficient, or if the grain appears any way rough, repeat the process. Be careful not to put too much of the brickdust, as it should not be rubbed dry, but rather as a paste upon the cloth. When the surface is perfectly smooth, clean your work off with a rubber of carpet, and fine mahogany sawdust. This process will give a good gloss and face to your work, and make a surface that will improve by wear. Indeed, by this process, soft Honduras mahogany will have the appearance of Spanish.

LIFE THOUGHTS.

We should beware of judging ourselves by what others think of us.

He who would stop every man's mouth must have a great deal of meal.

The more you exercise your memory the better and more reliable it will become.

An active life is the best guardian of virtue, and the greatest preservative of health.

Have the courage to provide entertainment for your friends within your means, not beyond.

A SINCERE confession of our ignorance, is one of the fairest and surest testimonies of our judgment.

It is always in our power to make friends by smiles; what folly then, to make an enemy by frowns.

A FIRM faith is the best divinity; a good life is the best philosophy; a clear conscience the best law; honesty the best policy; and temperance the best physic.

An honest reputation is within the reach of all men; they obtain it by social virtues, and by doing their duty.

CONTENT and patience are the two virtues which conquer and overthrow all anger, malice, wrath and back-biting.

GRIEF knits two hearts in closer bonds than happiness ever can; and common suffering is a far stronger link than common joy.

GOETHE said: "I must confess I should not know what to do with eternal bliss if it did not offer me new problems and new difficulties to be mastered."

EDUCATION.—Where education has been entirely neglected, or improperly managed, we see the worst passions ruling with uncontrolled and incessant sway. Good sense degenerates into craft, and anger rangles into malignity. Restraint, which is thought most salutary, comes too late, and the judicious admonitions are urged in vain.

A Beautiful Allegory.

A traveler who spent some time in Turkey relates a beautiful parable which was told him by a dervish; and which seems even more beautiful than Sterne's celebrated figure of the accusing spirit and recording angel.

"Every man" said the dervish, "has two angels, one on his right shoulder and one on his left. When he does anything good, the angel on the right shoulder writes it down and seals it, because what has been done is done forever. When he does anything evil, the angel on his left shoulder writes it down and waits till midnight. If before that time the man bows his head and exclaims, 'Gracious Allah! I have sinned—forgive me!' the angel rubs out the record; but if not, at midnight he seals it, and the angel on the right shoulder weeps."

YOUNG MEN.—Most young men consider it a great misfortune to be poor, or not to have capital enough to establish themselves at their outset of life in a good business. This is a mistaken notion. So far from poverty being a misfortune to him, if we may judge from what we every day behold, it is really a blessing; the chance is more than ten to one against the youth who starts with plenty of money. Let any one look back twenty years, and see who commenced business at that time with abundant means, and trace them down to the present day—how many of these now boast wealth and standing? On the contrary, how many have become poor, lost their places in society, and are passed by their own boon companions, with a look which painfully says, I know you not!

YOUNG men, learning business, hopeful of the future, a word with you! Cultivate and practice civility: It costs so little and is worth so much! A young clerk with civility, already has a stock of goods of his own. Regarded as mere policy it is the next best thing to honesty; and like honesty it is good for its own sake. An uncivil man is necessarily a discontented man, a discomfort to himself. We beg leave to add a new sentiment to the copy book of the period: Be civil and you will be happy!

To BREAK BAD HABITS.—Understand clearly the reasons, and all the reasons why the habit is injurious. Study the subject till there is no lingering doubt in your mind. Avoid the places, the persons, the thoughts, that lead to temptation.

Frequent the places, associate with the persons, indulge the thoughts, that will keep you away from temptation.

Keep busy. Idleness is the strength of bad habits.

Business Cards.

A NEW PATENT.

If you want a superior set of **TEETH** on Old, Rose-Pearl, or Pyroline, that will not loosen while masticating, call on **DR. BEERS**, 109 Montgomery street, opposite the Occidental.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third season. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier. You cannot take hold of it too confidently, and you can warrant your customers that it is Unequaled. For Whiteness and Brilliance of Flame, Economy in the use of Oil, Freedom from Smoke or Smell, Reliability in Wind and Motion, Coolness of Burner and Oil Cup, and Impossibility of Heating or Explosion, For the Variety of Places and Purposes to which it is adapted, the Readiness with which it Sells, and the Complete Satisfaction it Gives to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render All other Kerosene Lanterns so Disagreeable, Unreliable, Wasteful and Dangerous. Please favor us with your orders PROMPTLY, and oblige

Chicago Manufacturing Company,
MANUFACTURERS OF

YOUNG LADIES' SEMINARY, BENICIA.

The Twentieth Annual Session of this well known institution will commence on the
26th day of July Next.
Previous to that date there will be a complete renovation of the establishment. A fine School Room and many other improvements will be added, and new furniture, carpets, bedding and apparatus supplied.
The course of study and mode of instruction will be such as the best modern culture demands; and in every genuine advantage of school and home, the institution will prove its claim to a place in the first rank.
For particulars address
19v1-1mbp REV. C. H. POPE, Benicia, Cal.

POPULAR LECTURES.

Mathematics.

[Prof. W. F. Welcker before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Sixth Series. Reported expressly for the PRESS.]

LECT. I. May 27.—In commencing his lecture, the Professor referred to the nature of his subject, which was undoubtedly distasteful and even repulsive to the majority of persons, and therefore a very difficult one for a popular lecture.

Great Importance of Mathematics.

Mathematics is very commonly called the science of quantity,—which treats of those properties and relations of things which can be measured. But it may also be called the *science of truth*, of pure logic. In all other discussions we can draw no absolutely certain conclusions; there is always some doubt or possibility of error. In mathematical reasoning everything is sure, and it admits of no doubt.

The study of mathematics ought to stand high, on account of the great utility of the subject. Leaving aside the consideration of it as a means of training the mental powers, in which it pre-eminently excels, it affords the great means of investigation. All arts, sciences and occupations of men depend on it. Its influence pervades every class and condition of society, and every pursuit. By its aid the mariner is enabled to push boldly out to sea, trusting to the faithful compass to lead him through pathless wastes to his destination. By its aid we can weigh worlds, can measure the speed of light, which travels to us from the sun at the inconceivable velocity of 90 millions of miles in eight minutes; can measure the microscopic wonders of a drop of water,—individuals, millions of which piled together would not make an object as large as a grain of sand, and thousands of which can swim together through the eye of a needle.

Why so Distasteful to the Many.

If it is so important, the question naturally occurs as to why it is so distasteful to the majority of persons. The cause of this is to be found in the manner in which it has been treated. Until of late the study has been confined to the few, to persons of the highest power and training of mind, and the treatises on the subject have been written for these alone, and written in such a manner as to exercise the thinking powers of even these few. Mathematical works have not been made comprehensible by the many. Indeed, learned mathematicians have been known to maintain that the study should not be made easy, because then it would not train the mental faculties.

So arithmetic, until lately, has been taught in dry treatises and by what are called "sums," which are in fact puzzles contrived purposely to be as difficult of solution as possible. We should judge most unfavorably of a pioneer, whom we had sent to find a road through an unexplored region, and who should leave only such marks for us to follow, and at such great distances, that they were almost as difficult for us to find as was the way originally for him. We wish him to make our path easy. And in the same way we need aids in the study of mathematics,—to ease our way, not to set up puzzles for us to solve.

To Prof. Davies the lecturer would award the highest tribute of praise for being the first to popularize and simplify this important study.

Descriptive Geometry.

After his introductory and general remarks on mathematics, the Professor came to that particular topic, descriptive geometry, of which he proposed to treat especially. He explained the objects of this branch, its general methods and its rudiments. The nature of the subject, although a most important one, precludes the possibility of condensing the explanation. Only a full, verbatim report, accompanied by diagrams, would give a fair idea of the lecture; but such a report would occupy much too large a space in our columns.

THE HYDE ROAD STEAMER, of which we spoke last week, in its trial at Sacramento drew *three* of the State Capitol columns, or a total load of 39 tons. And, what is more remarkable, it drew this load for some distance with only one driving wheel in gear! This speaks well for the capabilities of the machine.

ST. LOUIS BRIDGE COMPLETED.—The great steel bridge across the Mississippi river at St. Louis was completed on the 11th of April. This bridge is one of the greatest mechanical structures in the country, having 11 piers, 2 abutments, and the largest draw span in the world, being 384 feet in length, and costing \$1,000,000. The bridge contains two roadways, one for the railroad track and one for foot and wagon travel. In addition to the draw span are two spans 250 feet wide in the centre, to admit of the passage of rafts. The completion of this bridge will greatly facilitate trade in St. Louis, which city is fast assuming great importance as an iron manufacturing center, and which already surpasses Chicago in the extent of its grain trade. The development of the mineral wealth of Missouri, which is yet in its infancy, but in which are included almost all the metals of commerce in inexhaustible supply, will serve as an additional source to ensure great prosperity to this firmly established prosperous trade center. —*U. S. Min. & R. R. Reg.*

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

READERS will favor ourselves and advertisers by mentioning the fact when they obtain information from our columns.

COUGH AND COLDS ARE OFTEN OVERLOOKED. A continuance for any length of time causes irritation of the Lunge or some other chronic Throat Disease. "Brown's Bronchial Troches" are offered with the fullest confidence in their efficacy, giving almost invariably sure and immediate relief.

Owing to the good reputation and popularity of the Troches, many worthless and cheap imitations are offered, which are good for nothing. Be sure to obtain the true "Brown's Bronchial Troches." Sold everywhere.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopathic and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate Steam Mills—Bridg Lane, London. Export Chicory Mills, Bruges, Belgium. 1625-ly

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market. We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the new blasting powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office. 16v20-3m

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be put in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office.

We had sought most every place in the city to find suitable eye-glasses, but found nothing but inferior ones until we entered the store of O. MULLER, 205 Montgomery street, where we were gratified to procure a superior article at a low price.

Scientific and Practical BOOKS

—ON—

MINING, METALLURGY, ETC.

BY GUIDO KUSTEL

MINING ENGINEER AND METALLURGIST.

Published and Sold by

DEWEY & CO.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quick-silver, 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, \$5 in cloth; \$6 in leather—coin.

PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points: Being built of wood entirely, they are not affected by change of temperature. The timber used is placed so directly in the line of strain, that less material is required to support the same load. It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH of SPAN. Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

"PAIN KILLER"
PROP.
1840 1870

The "PAIN KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and been largely used and highly prized. Moreover, there is no climate to which it has not proved to be well adapted for the cure of a considerable variety of diseases; it is a speedy and safe remedy for burrs, scalds, cuts, bruises, wounds, and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, it is admirably suited for every race of men on the face of the globe.

Another significant fact, that notwithstanding the long period of years that the "Pain Killer" has been before the world, it has never lost one whit of its popularity, but on the contrary, the call for it has steadily increased from its first discovery, and at no previous time has the demand for it been so great, or the quantity made been so large, as it is to-day.

Another significant fact, is that nowhere has the Pain Killer ever been in higher repute, or been more generally used by families and individuals, than it has been here at home, where it was first discovered and introduced. That the Pain Killer will continue to be what we have styled it, THE GREAT MEDICINE OF THE WORLD, there cannot be the shadow of a doubt.—*Providence Advertiser.*

To THE MINING INTEREST.—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanics' Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL to OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanics' Institute, care J. H. GILMORE, San Francisco.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the Scientific Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Altona Gravel Mining Company—Location
of Works, Grass Valley, Nevada County, California.
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the twenty-third day of May, 1871, an assessment of (No. 2) of twenty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, at the office of the company, No. 23 Merchants' Exchange, San Francisco.
Any stock upon which said assessment shall remain unpaid on Monday, the twenty-sixth day of June, 1871, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventeenth day of July, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees, **DAVID WILDER**, Secretary.
Office, No. 23 Merchants' Exchange, California Street, San Francisco, Cal. 21v22-1m

Altona Number One Gravel Mining Company.
Alta Hill, Grass Valley, Cal.
The first annual meeting of the stockholders in the above named company will be held at their office, No. 23 Merchants' Exchange, San Francisco, on Thursday, July 6th, 1871, at 2 o'clock P. M., for the election of Trustees, and the transaction of other business. By order of the President, **DAVID WILDER**, Secretary, jun3-5w

Hanscom Copper Mining Company.—Location
of Works, Low Divide District, Del Norte County, California.

R. PERRY,

Salamander Gold and Silver Mining
Company, Leon's Ranch, Mill Valley District, Calaveras County, Cal.
Notice is hereby given, that at a meeting of the Trustees of said company, held on the 4th day of May, 1871, an assessment (No. 4) of thirty-five cents per share was levied upon the capital stock of said company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Pfeiffer, at the office, No. 210 Post street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the 12th day of June, 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 10th day of July, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of the sale.
E. J. PFEIFFER, Secretary.
Office, No. 210 Post street, San Francisco. 19v22-4w

Yosemite Consolidated Mining Company—
Location of Works, Santa Fe District, Lander County, State of Nevada.
NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the twelfth day of April, 1871, the several sums set opposite the names of the respective shareholders, as follows:

Names.	No. of Certif.	No. Shares.	Amount.
Brandon, Peter.....	23	5	\$ 5 00
Brandon, Peter.....	34	20	20 00
Brandon, Peter.....	167	25	25 00
Brandon, Peter.....	163	60	60 00

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of April, 1871, so many shares of each parcel of said stock as may be necessary, will be sold by public auction, at the office of Maurice Dore & Co., auctioneers, 327 Montgomery street, San Francisco, Cal., on Monday, the 19th day of June, 1871, at the hour of 12 o'clock noon of said day, to pay the delinquent assessment thereon, together with costs of advertising and expenses of the sale.
DAVID WILDER, Secretary.
Office, No. 28 Merchants' Exchange, California street, San Francisco, California. 22v22-3w

Yosemite Consolidated Mining Company,
Santa Fe District, Lander County, Nevada.
Notice is hereby given that the Annual Meeting of the stockholders in the above named company will be held at their office, No. 28 Merchants' Exchange, California street, San Francisco, California, on Monday, the fifth day of June, 1871, at 12 o'clock M., for the election of Trustees and the transaction of other business. By order of the President, **DAVID WILDER**, Sec. 20v22-3w

THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY
 of sufficient capacity to supply their Asphaltum Pipe in
 large quantities.

Are now Prepared to Take Orders
 AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee
 it to stand any pressure required; it is lighter than iron
 pipe and more durable, it is not affected by chemical
 action, cannot corrode, and being glazed imparts no dis-
 agreeable taste to water. To miners and farmers it is
 invaluable; any hole can put it down; it is twenty per
 cent cheaper than iron pipe and ten times more durable.
 For further particulars, apply at the office of the Com-
 pany, Room No. 2, 645 Market street.

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

9v18-qr**Machinery.****GARRATT'S CONDENSING LUBRICATOR,**

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber B. F is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before re-charging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the ejection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C.
1e18-1f**Varney's Patent Amalgamator.****These Machines Stand Unrivaled.**

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and sellers for themselves, at the office, 229 Fremont Street, San Francisco.

4v22**AHEAD OF THE WORLD.****THE NEW TREADLE POWER,****Just Invented, and used exclusively on the HOWE SEWING MACHINE.**

With it any lady, however delicate her health may be, can run the Machine from morning until night with perfect impunity.

The Howe is the Best,
Consequently the most Popular Machine in use. The Daily manufacture is over 500 Machines.H. A. DEMING, Agent,
ap15-3m No. 113 Kearny street, San Francisco.**STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.**

This Pan is far superior to all others in several important particulars. The grinding mullers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the muller-plate openings efficiently force the pulp directly under the mullers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (Co-operative), 19 First street, S. F.

Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation.
15v20-1mr, 1am1f**WHY THE WILSON****Patent Steam Stamp Mill****IS THE BEST AND****Most Desirable Mill for Crushing Ores.**

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

A Portable Railroad.

We have at various times spoken of the Peteler Portable Railroad, which has been used with advantage at various places at the East. To-day we give an illustration which will convey to our readers a clear idea of how this road is constructed and managed.

The objects of this road are manifold. It is particularly adapted for making excavations, filling low land, for making wagon roads and railroad beds, for mines and quarries, for improving and cultivating farms, for transporting building materials, etc., etc.

The main track is made up of 20-foot sections, each section consisting of two parallel wooden rails, on the upper surface of which are riveted iron straps. These sections are connected to each other by simple fastenings, such as hook catches and eyes, so that they can be readily taken apart or connected. The rails are laid on the surface of the ground without sleepers, and with such ease that, it is stated, on level ground, two men can put down 1,000 feet in an hour. To complete the road, curves, branch-roads, frogs, bridges, turn-tables, etc., are added, all the parts being principally of wood and light enough to be handled with ease by a few men. A complete track of 1,000 feet, with all its appliances, can be easily transported on a common road on three 2-horse wagons, or in a single railroad car.

The bridges and rafts are composed of ordinary wooden rail sections, supported by boards, so that, when laid on soft or marshy ground, they will sustain the weight of the cars passing over them, without sinking in. The cars are so constructed that their contents can be readily dumped, and are so low that the operation of loading them is materially facilitated. They can be drawn by horses or men, as required. The track thus constructed readily adapts itself to the formation of the ground, as indicated in the engraving. It can be used at any time, and the workmen need never stand idle because the ground is too soft or too hard. The work can go on at all times and seasons.

As compared with men with wheel-harrows or horses and carts, competitive trials have repeatedly shown a great economy in using this road, besides its being practicable when the others cannot be used. As

compared with ordinary railroad-iron track, it has also peculiar advantages, for it needs no road-bed and no particular skill or amount of time for laying it. Its great distinctive advantage, however, is that it can be laid, taken up and relaid elsewhere in a few moments, and thus a single road may be made to serve the purpose of several fixed ones. It can be carried to each piece of work ready for use, without previous preparation.

The road has been employed for a great variety of work, and the best results have been obtained. In Prospect Park, Brooklyn, N. Y., large quantities of earth were moved to excavate lakes, fill up low places, etc. The cost of moving by this method was 13 cents per cubic yard, against 27 cents by carts, for even a short distance. Manifold examples could be given, but

The track had consequently to be changed and transported very frequently. But notwithstanding all these obstacles, a gang of twenty men filled and moved, on an average, six hundred loads per day, or three hundred cubic yards, the distance varying from fifty to five hundred feet.

The results furnished us denote that this portable railroad is of the greatest importance, and can be used in very many places on our coast with the best results. We call attention to it as a meritorious and labor-saving invention. A company has been formed in New York with the title of the Peteler Portable Railroad Company (office, 42 Broadway, New York city), which will give all further information desired. The success of this company at the East leads us to hope that they may find it to their interest to introduce the road on

the task of sustaining ourselves against strong competition. And we must more than sustain ourselves; we must be able to compete with any competitor and out-rival any rival. With the advantage of a climate adapted for working in, of position and prestige, with ordinary business tact, foresight and discretion, and some encouragement to manufactures and economic industries, we need fear no antagonist.

The library of the Institute has been increased by many valuable works. The financial condition has been bettered during the year. The gross assets amount to \$154,723.10; the liabilities to \$41,182.78; net assets \$113,540.32, or a gain of \$1,312.97 for the year. The mortgage on the building has been reduced \$3,000 and from 12 to 10 per cent. It is hoped that the next Industrial Exhibition will wipe out the indebtedness of the institution.

Eighth Industrial Exhibition.

Arrangements for the forthcoming exhibition have been pushed forward with all the energy possible. The special agent, Mr. J. H. Gillmore, has canvassed the city with excellent results, and reports applications for exhibiting space to the amount of 28,500 feet, more than the whole space occupied in 1869. It will be necessary to enlarge the area of the ground floor. The Bay District Horticultural Society will have a wing to be added to the south side of the Pavilion.

An agent has been sent to Japan for the purpose of obtaining

from that country a full exhibit of its productions, to call attention of its government to the manufacturing facilities of San Francisco, and to obtain the appointment of a Commission to the Fair.

To encourage the study of drawing and designing in the public day and evening schools, special premiums have been offered to the pupils thereof.

Wells, Fargo & Co., the Pacific Mail Steamship Co., the Central Pacific and the California Pacific have generously offered to transport over their respective routes, free of charge, all articles sent for exhibition.

TIMBER LAND BILL.—The citizens of Truckee, a most important lumber center, have resolved at public meeting to call for the passage of Hon. A. A. Sargent's timber-land bill, as a measure greatly needed.

THE PETELER PORTABLE RAILROAD.

we have space here for but one other.

A part of the city of Boston, called the Church Street District, being low, and the drainage imperfect, the city contracted for raising the houses and filling the streets, yards and cellars with gravel, from six to eighteen feet in depth. The gravel was brought into the city by steam cars, and dumped in the most accessible places, and it was at first distributed with wheel-harrows, it being impossible to use horses and dump carts. This method, however, proved very slow and expensive, except for very short distances, and the Portable Railroad was then tried. The work was probably the most difficult that a railroad was ever used for, as obstacles of every nature prevented straight runs, and the cars had to pass through openings in cellars, and around corners into back yards. The grade also varied for main streets and back streets, and for cellars and back yards.

our coast, where there would seem to be a need for some such construction.

Mechanics' Institute.

The annual meeting of the Mechanics' Institute was held on the 1st inst. President A. S. Hallidie read his annual address, which, in its general remarks, was characterized by practical sense and pointedness. He referred to the object of the Institute, the condition of the mechanics of this city, and the influence of the society in elevating this condition. He dwelt on the manufacturing interests, their present extent, their needs and their future possibilities. We have in this city 1,553 factories of all kinds, employing an aggregate capital of \$25,504,767, or with a total outlay of about \$43,900,000, producing material of a value of some \$36,462,400; with a total profit of 34 per cent. per annum. It is evident that we must give up our notions of isolation and

MECHANICAL PROGRESS.

PUNCHING.—One of a series of communications to *Engineering* from "An English Engineer in America," has the following: "Few comprehend the extent to which the matter of punching has been carried. Take, for example, the work at the Elgin Watch Factory. The blank discs for the wheels, after being punched from the sheet metal are perforated, leaving the delicate arms and rim with their edges perfectly square, corners sharp, and the surface so neatly finished that no hand work whatever is applied to them afterwards—in fact so good is the job, that the best hand work cannot approach it. To do such work with any degree of success requires not only a punch and a fitted mathematically perfect, but so arranged that they may be changed and set quickly and the punch guided so as to enter the die true beyond any possibility either from carelessness, or from slack motion in the machine. This hard problem has been beautifully solved by a simple device in which the punch, the die, and the holder for the die, and also guide for the punch are all cast in one piece. It will be seen that this is a complete structure within itself. When used it is put into and the punch receives its vertical motion from a common punching machine, and when another kind is required instead of changing punch and die, the whole thing is changed, neither punch nor die ever being taken out except for the renewal. In making a perfect guide to the punch and insuring its perfect entrance into the die, the difficulties are so great that were it not for the use of Babbitt's metal or its equivalent, it would be hard, if not impossible, to overcome them, but by receiving the die, in its seat, setting the punch in the die, and casting the Babbitt's metal around it, nothing remains to be done except to wear the punch in its guides until it works free. I am not certain but the work is repunched, that is, a punch a trifle smaller than the holes required used first, and afterwards one the exact size, shearing out, as it were, a finished shaving of metal. This plan has been adopted to a great extent in the manufacture of cold punched nuts. The holes in the nuts are punched first by a punch much smaller than the die, and the blanks cut out in a die much too large, then by repunching the holes and forcing the blanks through a die of the right size nuts are made free from scale, beautiful in appearance, perfect in shape and dimensions, and as none but the best iron will stand punching cold, they are of first-rate quality. The punching as a substitute for the milling machine in the construction of gun lock and pistol work has been used to a considerable extent, and it is believed with great success."

A NEW BELTING.—The *National Car-Builders* has the following: "We have been shown specimens of machine belting which, in our judgment, are a great improvement upon any of the kinds in use. The materials of which it is made are steel and rubber, so combined as to make available the strength of the one and the adhesive properties of the other. Belts of any size can be made. The specimens referred to are about four inches in width. In the center is a thin plate of steel, twenty-four gauge, to both sides of which, as well as the edges, the rubber is united by a peculiar process while it is being vulcanized; and so complete is the union of the two materials, that the rubber cannot be separated from the steel in any other way than by cutting or tearing it off. The superior qualities of such a belt, must be manifest to every machinist. The ordinary leather or rubber belting is liable to stretch, owing to the lack of that element which is in this case supplied by the steel. The metallic center prevents any elongation. There is no liability to slack or run off, and consequently no time is lost in taking up. It is not affected by moisture or by changes of temperature; and when one side is worn it can be turned, and the other side will wear equally long, being practically two belts in one. The ends are fastened by two clips with set-screws, without making any holes through it."

ACCELERATED MOTOR FOR SEWING MACHINES.—Dr. W. Chapman read a paper before a late meeting of the Polytechnic Club of the American Institute, describing a motor of his own invention. We quote from the report in the *N. Y. Engineering* for May 16th: "There is a fly-wheel, about nine inches in diameter, and weighing about fourteen pounds, which

is set in motion by turning a crank. Giving the crank five or six turns, it will run about three minutes at the rate of 600 or 800 stitches per minute; then, as soon as it begins to run too slowly, the operator, without stopping the work, turns the crank again. With the ordinary treadle, power is lost in stopping the fly-wheel or checking it at the end of a seam, or in turning the work, crossing other seams, etc.; but in using the motor the motion of the needle is reduced or stopped, and the fly-wheel continues to run, ready to start the needle instantly. The apparatus occupies about one cubic foot of space, and may be attached with equal facility to any sewing-machine. When desired, a treadle can be attached to the accelerated motor, enabling the operator to use either the treadle or the crank at pleasure."

THE INTERNATIONAL EXHIBITION.—This opened on May 1st, at South Kensington, in two buildings connected with the Royal Albert Hall by means of the Horticultural Society's Conservatory. The Exhibition is the first of an intended annual series. We copy the following remarks upon the plan from the *London Engineering* for the previous week:—"As we have said, the scheme of the Exhibition is a very commendable one; it is restricted to two or three classes of objects, and will be repeated every year. The classes of exhibits will be varied from year to year, until each class has been represented, which, according to the present programme, will be in seven years. At the end of that time the classes of objects exhibited this year will be repeated, and means will thus be afforded of judging correctly of the advance made in any special department of art or manufacture during seven years. The fine art division, however, is not subject to the same rule, but will be fully represented every year. The articles exhibited have to undergo selection by competent committees; this selection implies merit, and no prizes will be given by the Commissioners, the certificate of admission being the only recognition. But although the Commissioners do not award prizes to exhibitors, they afford every facility to individuals or societies desiring to do so for the encouragement of art or industry. The classes to which the Exhibition for the present year will be confined are mainly three, the fine arts, pottery, and woolen and worsted fabrics; the machinery exhibited relates to each of the two latter classes only. There are also educational appliances and instruments, scientific inventions and new discoveries, and horticulture."

BENDING DISCS OF SILVERED GLASS.—Mr. Nasmyth's plan for making concave glass reflectors for telescopic purposes, is as follows:—"A disc of silvered plate glass, 39 inches in diameter and 3-16 of an inch in thickness, is fitted and cemented into a shallow cast-iron dish, turned true on its face so as to render the chamber behind the glass perfectly air tight; by means of a tube communicating with this chamber, any portion of air can be withdrawn or injected. To produce a concave mirror so slight power is required, that on applying the mouth to the tube and exhaling the chamber, the weight of the atmosphere, which amounts in this case to 3558 lbs., acting with equal pressure over a surface of 1186 square inches, causes the glass to assume a concavity of nearly three quarters of an inch, which in a diameter of 39 inches, is far beyond what would ever be required for telescopic purposes. On re-admitting the air, the glass immediately recovers its plane surface, and on forcing in air with the power of the lungs, it assumes a degree of convexity nearly equal to its former concavity. The degree of concavity or convexity may be regulated to the greatest nicety, and it is proposed to render the degree of concavity constant by placing in the air-tight chamber a disc of iron turned to the required form, and allowing the pressure of the atmosphere to retain the glass in the form given to it by its close contact with the iron disc."

NEEDLES.—The agents of the two leading makers in Boston, report the aggregate sold in Boston, New York, and Philadelphia, as about one hundred and sixty million of needles per month, running from 75 cents to \$2 per thousand. The sales chiefly are on the numbers from 5 to 10, while seven-eighths of these orders take the numbers of 7 and 8. Knitting and darning needles, that 25 years ago were sold in amount over double the sales of sewing needles, have dwindled to a very insignificant item of stock. They can hardly be said to sell now at one-twentieth of their former amounts. Crochet needles have a very large sale, and have taken the place made vacant in stocks by the disuse of the darning and knitting needles.—*Sci. Am.*

SCIENTIFIC PROGRESS.

SCIENCE OF COLOR AND MENTAL SCIENCE.

In a late lecture before the Royal Institution, Prof. J. Clerk Maxwell illustrated Young's doctrine of color vision, and remarked that it was the first consistent theory of color. The elementary truth recognized thereby is that the difference in colors must be sought not in the nature of light but in the constitution of man. The explanation is therefore not to be reached by the study of pigments nor in the analysis of the rays of light. We quote a paragraph or two from Prof. Maxwell's lecture:—"I have here a picture of the structure upon which the light falls at the back of the eye. There is a minute structure of bodies like rods and cones or pegs, and it is conceivable that the mode in which we become aware of the shapes of things is by a consciousness which differs according to the particular rods on the ends of which the light falls, just as the pattern on the web formed by a Jacquard loom depends on the mode in which the perforated cards act on the system of movable rods in that machine. In the eye we have on the one hand light falling on this wonderful structure, and on the other hand we have the sensation of sight. We cannot compare these two things; they belong to opposite categories. The whole of metaphysics lies like a great gulf between them. It is possible that discoveries in physiology may be made by tracing the course of the nervous disturbance 'up the fine fibers to the sentient brain;' but this would make us no wiser than we are about those color sensations which we can only know by feeling them ourselves. Still, though it is impossible to become acquainted with a sensation by the anatomical study of the organ with which it is connected, we may make use of the sensation as a means of investigating the anatomical structure. A remarkable instance of this is the deduction of Helmholtz's theory of the structure of the retina from that of Young with respect to the sensation of color. Young asserts that there are three elementary sensations of color; Helmholtz asserts that there are three systems of nerves in the retina, each of which has for its function, when acted on by light or any other disturbing agent, to excite in us one of these three sensations. No anatomist has hitherto been able to distinguish these three systems of nerves by microscopic observation. But it is admitted in physiology that the only way in which the sensation excited by a particular nerve can vary is by degrees of intensity. The intensity of the sensation may vary from the faintest impression up to an insupportable pain; but whatever be the exciting cause, the sensation will be the same when it reaches the same intensity. If this doctrine of the function of a nerve be admitted, it is legitimate to reason from the fact that color may vary in three different ways, to the inference that these three modes of variation arise from the independent action of three different nerves or sets of nerves."

A THEORY OF A NERVOUS ATMOSPHERE.

Nature for May 11th notes a new theory suggested by Dr. Richardson, and remarks that it is calculated to give rise to much discussion. We quote briefly, condensing:—"The theory is in some sense a return to the old view respecting nervous action [fluid hypothesis], and in some sense also is an extension to the nervous system of the physical idea of communication of motion by molecular disturbance. In a few words, the author supposes that the blood, as it circulates through the vessels, yields a diffusible vapor or atmosphere which charges the nervous system, surrounding the molecules of nervous matter and pervading the whole nervous organism. He attempts to formulate the physical qualities of this vapor; it is probably an organic vapor containing carbon, hydrogen, and nitrogen; it is insoluble in blood, it is condensible by cold, diffusible by heat; it possesses conducting power, as a physical substance is susceptible of variations of pressure; it connects the nervous system in all its parts together; it is the medium of communication during life between the outer and the inner existence; by the organs of the senses the impressions and motions derived from the outer world are vibrated into or through the nervous atmosphere to the brain; in the living and healthy animal the nervous ether, if we may so designate it, is in correct tension, in the feeble it is diminished, in the dead it is absent or inactive; in the waking times of the living it is most active; it may be used up faster than it is produced during exercise; it is

renewed during sleep. On the supposition of the existence of a nervous ether or atmosphere, the author accounts for various phenomena. It is assumed that vapors of chloroform or alcohol, for example, taken into the blood and carried to the nervous system, become diffused through the nervous atmosphere. "The foreign vapor that has been introduced henumbs; in other words, it interferes with the physical conduction of impressions through what should be the cloudless atmosphere between the outer and the inner existence." The rapid action of certain poisons, and the diffusion of the products of decomposition generated within the body itself, in disease, and the sudden collapse of nervous action which is often seen, are similarly accounted for by the author of the theory."

THE PROVISIONAL HYPOTHESIS OF PAN-GENESIS.

—This, so called by Darwin, is getting raps from the scientists on all sides. Upon the point that the reproductive gemmules are diffused or suspended in the fluids which circulate freely through all the tissues, Dr. Lionel S. Beale ironically remarks in *Nature* for May 11th:—"Depend upon it, neither the well-devised experiments of Mr. Galton, nor any other experiments that may be devised, will overthrow this doctrine. The provisional hypothesis of pan-genesis is perfectly safe, and will withstand every attack that may be made. It cannot be successfully assailed. Like many favored hypotheses of these days, it can neither be proved to be true nor positively shown to be false, and it is open to anyone to ground his belief in the truth of this and other doctrines upon the fact that they have not been and cannot be disproved. For undoubtedly gemmules may be formed in the manner supposed; if formed, they may be detached; if detached, they may pass through the tissues; they may then collect together, and may form reproductive elements. Each one of the countless millions of sperm elements produced in each profusion during so many years of life may, indeed, be formed by the union of millions of gemmules which, after meandering through the various textures of the body, marshal themselves in order in one particular locality. From the vast company thus supposed to have collected, we may conceive, by the light of imagination, the formation of regiments composed of multitudes of individual gemmules of the same kind; and further, it is not difficult to imagine that each individual gemmule of every regiment may move away and unite with thousands and tens of thousands of others, to form at length that marvellous compound and complex speck of matter less than the 1-50,000 of an inch in diameter, which constitutes the active material of each small reproductive particle. * * We may be led from the consideration of the broad facts of nature to conceptions of the most abstract kind, without being conscious of the slightest gap between the facts of Science and the creations of the Imagination. In these days the utmost skill is often displayed in hiding and ignoring or denying the hiatus by which the arguments deduced from the results of observation and experiment are separated from those which are based upon the fictions of the fancy. But, unhappily, the gulf cannot be filled up, or bridged over. It may be obscured by mists and clouds, but, though it be lost for a time, it is sure to be rediscovered and its limits studied by the curious and unphilosophical. Nowadays analogical argument is employed very freely without any attempt to show, in the first place, that there is any real analogy between the facts upon which the reasoning is based. In order to convince people that a hypothetical gemmule may move long distances through all sorts of tissues, it is only necessary to show that actual matter, millions of times as large, does burrow a short distance through certain textures. * * The pangenetic gemmule cannot be seen or tested, neither can its presence or absence be proved in any way. The phenomena adduced by Mr. Darwin in support of his hypothesis can be demonstrated; but the pangenetic gemmules are of the imagination alone, and the analogy between the actual facts and the supposed facts is purely but an analogy of the imagination."

MOLECULE—ULTIMATE—ATOM.—In a late number of the *Quarterly Journal of Science*, Mr. Mungo Ponton in his short paper on Molecules, Ultimates, Atoms, and Waves, suggests the use of the term "molecule" to denote the particles of chemical compounds; "ultimate," those of chemical elements; and "atom," the assumed constituents of those ultimates, themselves incapable of further analysis.

CORRESPONDENCE.

Wastage of the Precious Metals—No. 2.

BY ALMAHIN B. PAUL.

[Written for the Press.]

From data of loss, given in my last article, we must come to the conclusion that gold mining, not only in California, but elsewhere on the Pacific slope, as all are operating on about the same system, is unquestionably behind all other branches of industry in perfectness, and certainly not up to the point it should be. In fact, so imperfect is it, that our gold mining enterprises, as a whole, may be set down as a failure, when the question of profit in all is considered. If it can be considered highly successful in this general sense, ought we not now to be teeming with prosperity?

That some change should be brought about, must be evident to all. What that change will be or should be, each must determine for himself. In order to better the interest, all operators should give their attention to increasing the percentage of yield without a corresponding increase of expenditure. There is a benefit, however, in producing more even with an equal expenditure, as it gives an additional amount of metal for circulation, and requires an equivalent of labor. But this idea, although correct, is an unpopular one; it doesn't belong to the selfish spirit of the age, for without a profit on labor, it is not wanted. This age is for profit, not good unless the "good" makes the profit.

One step in advance would be,—taking more care. There is too much slashing about in our gold mining. There is enough in silver, but no comparison between the working of the two metals. This plan of seeing how much can be pounded up and rushed through every 24 hours, is a false, wasteful and ruinous system.

The profit will be found in *how well* and how cheap it can be done. It is in the right direction certainly to reduce ores expeditiously and cheaply, but not to as expeditiously wash everything away, having an eye more to pounding up the rock, than to taking up the metal. The following slip, clipped from the Press, to my mind, tells quite a long story in itself: "Here is a 40-stamp mill, that pulverizes its 250 tons weekly, employing 40 to 100 men. The ledge averages five feet thick. The Montezuma, too, is located here; but for reasons best known to the company, they have permitted their 20 stamps and good mine to remain idle for the last two years."

Forty to a hundred men getting a mine, to run how much down stream? I know several similar institutions which work from "40 to 100 men," and at the end of the month the owners do not have one dollar for themselves; whereas less expense, less rush, and more metal saved, could turn the scale often from loss to profit, and "20-stamp mills with good mines" need not be idle. I contend that ore can be reduced, held under control for manipulation, and metal amalgamated as cheaply as this uncontrollable sluicing system so universal in California.

That our gold ores are so readily amalgamated, is one of the ruinous ideas extant. The majority of California miners are, in fact, but little experienced in all the troublesome accompaniments of even gold ores, considering that if the rock does not pay, that it cannot certainly contain it. All, however, admit it to be difficult to extract the gold from iron sulphurets, forgetting that even a small percentage of lead, copper, arsenic or antimony which is to be found in nearly all the gold ores of California, vitiates the mercury in a little while, rendering it quite inefficient in collecting even the gold that otherwise from gravity might be taken up. We hear great accounts of the value of the ores in San Diego Co.; but do they prove up their assertions by the product per ton? One of your correspondents, only a week or so ago, stated in his communications that 'we must have improved machinery or abandon this in use.' He had been investigating the matter. It is too universal to consider that it is only necessary to rig up a set of stamps, apply the power, and let them rip away smashing rocks, to wash over blankets and copper plates; and all is done with a stream of water to wash the sands off, forgetting that it is equally as patent to wash off the smaller particles of gold.

We boast of our mechanical and scientific skill, our 22 years experience, our great discernment and independent action, and yet are bowed down to our grandfathers' ideas of working gold ores, and, on the average, do not extract 50 per cent. of the riches contained therein. Is there not a contradiction in our boasts, when compared with results?

Some will say, it is all well to talk about loss of metal, but how can we prove it, and where is the remedy?

I will tell you how to prove it, but each must work out his own remedy. For my part, I have worked out the loss by what I consider the remedy—dry amalgamation—but our subject now is loss, not remedy. To awaken the mind for improvements, and be interested in a remedy, miners must first realize their loss. I contend there are several ways of working our gold ores better than the one now universally used in California. If you want to get a clear comprehension of your loss, take say 5 tons or more—not less. Reduce the ore dry through say No. 20 wire cloth screens; mix all thoroughly, then spread it out upon a floor about two inches thick. Lay it out in 12-inch squares, take a smaller quantity from each square, take samples thus obtained, and again mix them. Again spread out say one inch thick, laid out into 4-inch squares, taking a smaller portion from each. Reduce this sample to powder; if too much for average assays, sample again as before. Got 3 or 5 assays from reliable assayers, average the assays. Work your ore by your mill process; compare the results with assays; and in nine cases out of ten every one will find they possess more riches than they thought they had. Any other system of testing is unreliable. Pieces of rock can be had to assay more or less as you want. To get at the value of your mine, the testing of tons by this mode is the only safe one. It is troublesome, and these "old time" gold miners, who have got it all, don't want to be troubled. The less bigoted ones, however, may find time and take an interest in doing so, and receive, I doubt not, a pleasurable lesson. As I happen to be in the unfortunate position of trying to benefit the pursuit in which I take the most interest studying, I will receive it as a favor, if parties who should make any tests as the value of their ores, in connection with the loss, will send me the results of any experiments. I said "unfortunate position," as I clearly realize the fact that it is unfortunate for any one in California to start out of the old beaten track, or to show the least enterprise, outside of "interest;" for by so doing he too often becomes the pay of those—

"Whose hungry maws are only bent
On the fine feast of cent. per cent."

Kearsarge Mine, Inyo County.

EDS. PRESS:—I took a trip up to the famous Kearsarge works, the other day, to see the improvements at that point. Through the kindness of Gen. J. B. Winters, one of the chief owners and the present Superintendent, I gleaned the following:

Tramway—MILL.

A tramway, 1,500 feet in length, has been built down the mountain side, at an incline of 38°, to a point about 500 yards from the mill, for the purpose of delivering the ore. Thence it is loaded in wagons and hauled and dumped into the battery room. The estimated cost of delivery from the mine to the mill is 50 cents per ton. Formerly it cost \$15 per ton to get the ore to the same place.

The tramway is a double rail with a switch in the center of its length for one car to pass the other; the cars are built on a new plan, (new to me, at least) having the outside wheels of each car with double flanges, which enables them to take the switch with an accuracy which seems wonderful when seen approaching at such a speedy rate as they generally travel down the mountain. The engineer, Mr. Thompson, of Virginia City, has added another feather to his cap, by the successful manner in which he has been able to accomplish this work. The mill has, under his management, been also changed from a steam mill into a water power, by the means of a "Leffel turbine" of 13 inches in diameter, with a large water pipe leading down the mountain, from a water ditch leading from the cañon. The water has 120 feet fall, and strikes the wheel with a force of 9 tons, and with a one-sixth inch opening will drive the wheel at the rate of 2,000 revolutions per minute. While I was present the water was turned on with the result as above stated. All the machinery of the mill has been thoroughly overhauled by competent mechanics, and is now ready

to start up. The mines are being worked, and excellent rock was being delivered in the dump house before I left.

The Mines.

This cluster of mines has always been considered to be among the best in our county,—but heretofore work has been done at such a disadvantage that it has taken ore of almost fabulous richness to pay the expense of working. It is now the intention to work all the quartz contained between the walls (making a body of an average thickness of four feet), the lowest assays of which are \$27.50 per ton, and Mr. Winter assures me that he can mine and reduce rock with his present facilities for \$9 per ton, or at a cost of ¼ of the lowest assay of his ore. On the other hand there is a vast amount of rock in the mines that assays from \$100 to \$2,000 per ton.

Some \$40,000 have been expended on the above improvements since the 1st of April, and considering the inaccessibility of the locality and the immense amount of labor performed, it seems almost an impossibility that it should have been completed in such a short space of time. I have a statement from the very best of authority that there is now at least one and a half millions of dollars worth of ore in sight and ready for extraction.

Possible Sale.

A few weeks ago, a party of mining experts and engineers paid a visit to this mining property, in behalf of an English company, with the view of negotiating the purchase of the same. The owners put a price upon the property, but stated at the same time that the work would progress without reference to the likelihood of a sale being made, as they were perfectly satisfied with their prospects of a fortune.

If this company should conclude to purchase the Kearsarge property, it is the intention of Mr. Van Gorder and Gen. Winters to invest in other mining enterprises in this county. So, rather than otherwise, I should like to see the sale made.

I will give you the results of this company from time to time as I receive them, as I think upon it depends, in a great measure, the prospects of Inyo County.

CROWQUILL.

Independence, Inyo Co., May 22d.

The Siege of Paris—Dynamite.

[Condensed from London Engineering.]

During the seven months of the siege of Paris, the industrial arts and sciences lent their earnest co-operation to the long sustained work of the defence; and a vast number of problems were presented, for which solutions more or less successful had to be discovered.

What had to be Done at the Siege.

It was necessary to cast heavy ordnance, to make mitrailleuses, to build gun carriages and ammunition wagons, to obtain vast supplies of projectiles, to convert old-fashioned muskets and rifles into efficient pieces, to turn out powder and cartridges, and to prepare formidable explosives. Turning to other equal or even greater necessities, there had to be erected hundreds of mills to convert into flour the immense stock of cereals stored up in the city, and to build or adapt establishments for the salting, or preserving in other fashions, the flesh of thousands of oxen and horses, to boil down their fat, or produce concentrated soups. Again, the civil uses of electricity being held in suspension, it found a thousand uses for military purposes, for the transmission of orders, for the working of the torpedo service, for the electric light which played so conspicuous a part during the siege; the post-office pressed all aerostats into its service, and requisitioned many photographers; substitutes had to be found for gas and for coal. Such an enumeration might be extended indefinitely, but these few examples must suffice to give an idea of the manifold requirements.

There were two great and distinctive characteristics which gave to all these problems a special and peculiar interest. First, the rapidity with which it was necessary to arrive at the desired end; second, the constant absence of the ordinary elements of success necessary under usual circumstances. Often there were lacking the prime materials, nay, the very tools. We propose to dwell on some of the improvised industries prosecuted during the investment, and in the present article shall speak of the manufacture and employment of dynamite.

Manufacture of Dynamite.

A commission of experts, under the

control of the Minister of Public Education, was appointed for this, and two manufacturing were established. The glycerine was requisitioned from candle factories and the necessary acids were obtained in abundance. More difficulty was experienced in getting the absorbent body, it being of course impossible to obtain the silicious earth from Gormay which Nohle employs. After a variety of things had been tried in vain, the ashes, properly cleaned and sifted, of Scotch boghead, largely used in Paris in the manufacture of a portable illuminating gas, were employed. These absorb twice their weight of nitro-glycerine, without losing their granular appearance or becoming plastic.

The glycerine is treated with nitric acid, forming nitro-glycerine and water.

In order to remove the water, which is separated as soon as produced, concentrated sulphuric acid was used, in such manner that practically the glycerine was treated by a mixture of both acids. The mixture was placed in capsules of enamelled iron, arranged in vats filled with cold water. The glycerine was discharged into this, in a thin stream, from flasks shoving the vats.

The combination of the glycerine with the acids disengages a vast quantity of heat, which must be absorbed to keep down the temperature and thus prevent the nitro-glycerine from being destroyed and causing an explosion. For this end, electric thermometers of an extremely ingenious arrangement were employed to denote when a temperature of 20° Centigrade was reached. To reduce this temperature, the flow of glycerine was checked, or the water in the vats was changed or cooled with ice, or, in case of contingency, the capsules, arranged for this event, were emptied into the vats. It was necessary to keep the mixture of glycerine and acids constantly agitated, and this was done either by rotating stirrers driven by clockwork, or by an air blast.

When the reaction came to an end, the contents of the capsules were turned into the water, and the nitro-glycerine collected at the bottom and decanted. Afterwards it was washed thoroughly with an alkaline lye, until test paper gave no indication of acid. This was a vital point, for the nitro-glycerine acid explodes spontaneously. The oil and the absorbent powder were then mixed on a lead plate with a glass trowel until homogeneous and, as dynsinite, packed in zinc cans.

The Uses of Dynamite.

The dynamite was then put into the hands of engineers and experimented with for its military applications. Special means were necessary to cause its explosion. Fire burns it without violence, concussion does not effect it, and there is scarcely any means of exploding it except with a strong cap heavily charged with fulminate. The cap can be exploded with an electric spark, or with a fuse, or by means of a priming. But it is absolutely necessary to keep the sparks from the fuse from contact with the dynamite, else this merely burns without exploding.

Experiments were made in charging shells, which can be fired from the gun in the usual manner without exploding. A much smaller charge than that of powder suffices. But this application was not followed up.

Trials were made in destroying cannon. A bag of dynamite placed within the muzzle of a gun breaks it. A number of dynamite zinc cartridges were prepared for the German guns, but the opportunity of using them never presented itself.

It was found useful in quickly preparing barricades for road obstruction, for protecting a retreat or for guarding a position. A linen bag holding 7 to 9 pounds wrapped around a tree of 5 feet girth, on explosion, brought it to the ground, now cut off short and clear at the point of explosion, now torn into long jagged splinters.

The explosion of 6.6 pounds simply placed on a 2-inch rolled iron armor plate, broke the plate in exploding, and made a large hole in the ground. For effecting breaches, blowing down gates, destroying stone walls, etc., it only required to explode the dynamite on the surface of the obstruction. It was often used thus, and was also employed effectively in breaking up the thick ice on the Seine, when the gunboats were frozen up. It was used, after the siege, for removing heavy masses of masonry and iron work, which would otherwise have required powerful cranes and other mechanical appliances which were not readily available. Another application was for wholesale fishing.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miner*, May 27th: Freight to the amount of twenty-seven thousand pounds was hauled in this week for the Monitor & N. W. Mill. Next trip as much more machinery for the same mill will come up. These teams load back with ore from the Leviathan, for Dayton.... In the Exchequer, a cut westerly to the hanging wall developed last week a small vein of quartz, bearing sulphurets, which assays over two thousand dollars per ton in gold. The extent is not determined.... This afternoon, the director of the M. & N. W. Mill will make a "hee" to raise the sixth story.

AMADOR COUNTY.

SUTTER CREEK.—*MINER'S STRIKE*.—On the morning of June 1st the "Miners' League" made a strike for higher wages, and, marching in procession, closed the Keystone, Little Amador, Hayward's, Poundstone's, Downs, Mahoney's, and California mines. They then passed to the Amador mill and took possession. But the officers of the Co. had made a clean-up and had their bullion safe. They then proceeded to the Amador mine. The President having arrived from San Francisco met them in company with Superintendent Stienberger, and after listening to their demands, told them the Co. was paying to-day the wages they did pay twelve years ago; would make no concessions; while they owned the mine they would run it to suit themselves. The mob after taking all the men out of the mine, went to the Oneida and did the same. The officers of the Amador Co. have resolved to defend their property at any cost.

The *Ledger* of June 3d truly remarks: "Strikes of this character seldom result in good, and as a general thing those engaged in them are the sufferers in the end."

FINE VEIN.—The Kennedy Co. have a vein of ore in the bottom of their shaft five feet wide, of very rich quality.

CALAVERAS COUNTY.

MORE DUST FROM RAILROAD FLAT.—*Chronicle*, June 3d: On Saturday Swank Brothers, of Railroad Flat, brought to town the proceeds of forty tons of rock from their mine. The quartz paid \$36 per ton, the whole aggregating \$1,440. The Swank mine is on the Poe lead. The shaft is not over 40 feet in depth.

ITEMS.—Paul & Co., near the Junction, are still taking out fair gravel. A large force is employed.... But little is doing at the Junction. Whittridge's mine is being worked but not steadily: The outlay of a small amount of capital would develop it into one of the best claims on the ridge.... In Chili Gulch, Shaw, Brackett, Calaveras Tunnel Co., and French Co., are at work. Shaw and Brackett are doing well, we know nothing in reference to the others.... Bates & Co., in Stockton ridge, continue to receive large returns. There is no question but that their claim includes 200 feet of the famous Stockton Hill lead.... The machinery on the What Cheer will be in readiness to start next week. Wells and Gleason are pushing things.... The Union Shaft boys, in Corral Flat, are taking out gravel that prospects well. They have not washed up since sinking their present shaft. They find the old diggings badly caved, and are running across the lead to reach new ground.... On the west side of Stockton ridge Megaw & Co. are still at work. The lead appears to elude their search, however.... At Sport Hill, Mosher & Co., Johnson & Co., Collins and others are washing away with vigor and fair results.

SAN ANDREAS.—Cor. of same: There can be no question now as to the richness or extent of the ledge on which Mr. Thorn has located. The gold is fine, and thoroughly diffused throughout the rock. From all the bearings, his claim must be on the belt of the celebrated Hayward mine in Amador. His shaft is now over 160 feet in depth; the vein has widened gradually to five feet. Two feet of "gouge" upon the hanging wall has been perforated and another vein revealed. The thickness is not yet known. Excellent buildings have been erected over the works, and all the appliances are first-class.

INYO COUNTY.

INDEPENDENCE.—Cor. of Sonora Democrat, June 3d: The Cerro Gordo mines and furnaces, ship from 10 to 12,000 pounds of bullion per month. The Front mine at Cerro Gordo is estimated as worth \$1,000,000. The Eclipse mine belongs to an En-

glish company. This Co. has several other mines of importance and has set apart \$500,000 of their capital to carry out this speculation in Owen's River Valley. Their mill is situated on the East bank of Owen's river twelve miles south of Independence. The company purchased the mine a year ago for \$150,000. The Kearsarge, in the Sierra Nevada, is principally owned in Virginia City and Gold Hill. It is not as rich as the Eclipse, although a valuable mine.

NEVADA COUNTY.

TOWN TALK MINE.—*Grass Valley Union*, May 31st: We saw yesterday a lot of retorted gold, worth about \$5,000, the proceeds of a month's run of the Town Talk gravel mine. The eight stamps are driven by waterpower, and all the gravel taken out is put through. The profits of the run for this month are over \$2,500. There are only three owners.

GEN. GRANT MINE.—The Co. have had a crushing at Perrin's mill and Saturday a clean up was made. The number of tons crushed was ten, and the yield \$518.50, or \$51.80 to the ton.

GRANTVILLE.—Cor. of *Gazette*: Mining operations continue active. The Erie has not changed hands yet; the rock looks rich, and there is plenty of it. The mill is kept constantly employed. The Black & Irvin mine is going to pay a handsome dividend the coming clean up. It is reported that they have struck the ledge in the big tunnel at Rocky Glen, formerly owned by D. W. Snapp, the rock shows free gold, and the vein is three feet in width. Mr. Mowrey expects to strike his ledge in the tunnel next week. The Star lately crushed some rock which paid \$16 per ton. The Mary Emma mine, in "God's Country," owned by Caddy, Down & Co., is looking fine. The ledge is over four feet wide. They have a six stamp water mill. The gravel miners are busy.

BRUSH CREEK.—*Transcript*, May 31st: The miners are busy, and more gold will be taken out than last year. John Hall, on lower Brush creek, is working ten men, and Calkins & Townsend, above, forty. On Myer's Ravine, Calkins & Bro. are working six men. Howe at Shelby Hill is using a large amount of water and running at night. COLUMBIA HILL.—Woods & Co., and Nichols & Co. are at work. The latter claim has been fitted up with iron pipe and a large size Monitor nozzle.

A STRIKE IN THE ROAD.—Same of June 3d: On Wednesday Wm. Michels and another man made one of the richest discoveries ever made in this State, on the Washington road, five miles from this city, at a point where several old roads come together. The parties walking along the road found a lump worth eight dollars. On Thursday they went up and panned out \$84. Yesterday's stage stopped on the down trip and the 11 passengers picked up \$10 to \$12 in an hour. The surface prospects from \$10 to \$12 to the pan, in coarse gold.

The *Gazette* of the same date says that the two men have panned out about \$800 since the morning before.

The *Transcript* of the next day recalls the fact of the loss, in 1861, of a purse containing nine hundred dollars, by the stage owner on that road; and suggests that the purse, hidden by the dust, may have been broken open by passing teams, and the gold gradually scattered over the eighty feet or so of level ground where it was found.

BLUE TENT.—The miners are at work with good prospects. The Enterprise Co. is running 400 inches of water, the Last Chance Co. has purchased the Swallow Flat claims, and are cleaning up. The mines at Gopher Point show fair prospects.

[Owing to a mistake, the mining summary of the remaining counties will have to be deferred until next week.—Ed.]

Nevada.

ELY DISTRICT.

REVIEW.—*Record*, May 28th: All the mines in the District are looking well. Thousands of tons of fine milling ore are on the dumps awaiting an opportunity to be worked, and crushing power is all that is needed to enable us to treble our present hullion shipment. Custom mills are the present great want of the District. The mill at Silver Park, owned by Sam Ferguson and H. C. Chandler, is kept running on custom ore from this District and much is sacked and sent to other camps.

ITEMS.—Pioche mine is working 43 men and shipping 20 tons per day to the Chicago mill, in Meadow Valley. The machinery for the Stetefeldt furnace, is on the way from San Francisco.... Bovey incline is down 105 feet and the perpendicular shaft 85 feet. The ore will compare favorably with any in the District, as the average assays are \$400 per ton, and it is scarcely possible to pick up a piece from the dump

in which horn silver is not to be seen. The ledge is twenty inches to four feet in width. They have five hundred tons on the dump.... Barton is down 115 feet. About 60 tons of good ore on dump....

Alps ore averages \$250 to \$400 per ton, with 60 tons on dump. An offer of \$25,000 was recently refused for this mine.... Pacific Tunnel No. 2 is in 175 feet, and a ledge has just been struck. The indications are excellent.... Meadow Valley has two hundred men employed. About 60 tons of ore shipped per day to the mill in Dry Valley, which is running 30 stamps night and day.... Raymond & Ely Co., send 35 tons daily to the mill at Meadow Valley. The receipts of bullion are increasing every week....

Meadow Valley Extension have a fine whim and house complete; the shaft is down 240 feet and will be sunk ten feet more before opening the fourth level, having already cut into the ledge in three places, in all of which the ledge looks well. The ledge has been for the last 15 feet in the shaft, and is three and a half feet wide.... Superior shaft 70 feet deep with a ledge of 18 inches. Assays recently have reached as high as \$1,160, but average \$100 per ton.... Silver Peak is 150 feet deep and still sinking, with plenty of fine ore in sight.... Bradley shaft is down 25 feet, and rock assays \$140 to \$260.... Vermillion shaft is down 120 feet and plenty of good ore in sight.... Creole and Washington still idle owing to injunction.... American Flag shaft down 90 feet; taking out rich ore.... Richmond about 85 feet down; large quantities of pay rock taken.

BULLION.—Same of June 1st: Wells, Fargo & Co., shipped, May 26th and 28th, by way of Salt Lake, bullion \$17,357.10.

Pioche agent of W. F. Co., informs H. S. King that the amount bullion shipped from that office for the year ending May 1st is \$1,862,544.

ESMERALDA.

MILL BURNED.—*Carson Register*, May 31st: We learn that the Kean mill, at Pine Grove, which has recently come into possession of ex-Governor Blasdel and Mr. Williams, was burned down on Sunday morning last. Active preparations were being made by the new proprietors to start up the mill and mine with a full force. Later accounts state that the excitement of the people is great, and that it is not unlikely to find vent in the hanging of James Rhodes, the arrested party.

EUREKA DISTRICT.

PHENIX SMELTING WORKS.—*Sentinel*, May 31st: The buildings are being increased, and arrangements making to get the ore down in sufficient quantity to run during bad weather without stopping. They are working about 50 men, and their prospects have never been better.

STRIKE.—On Saturday a fine prospect was discovered by Capt. Maxwell in the foothills. He brought into town some pieces, a sample of which assayed, \$1,100. The discoverer is the sole owner.

JACKSON FURNACE.—This has been running for some time with the best success. John Williams will soon have booth furnaces running, and we shall then look for an old time yield.

BUTTERCUP CO.—Same of June 1st: Col. Robbins, Supt., will at once proceed to explore thoroughly several of the Co.'s mines.

RICHMOND.—Same of 3d: A new body of ore, cut in the deepest workings a few days since, has been drifted upon until it has proved to be one of the largest bodies of carbonate ore in the district. The lowest assay has been \$67.83 to the ton. The success of this company is great, and the dividends as large as any in the State.

OTHO MINE.—Same of 4th: This is 2,000 feet east of the Bullwhacker, which was sold the other day for \$75,000. Sixty days ago, Messrs. Strout and McGee bought two-thirds of it for \$2,000, and commenced sinking. The main shaft is now 110 feet deep, and they are taking out five tons of ore daily, which is sold on the dump for \$25 to \$40 per ton. They have 2,000 tons in sight, and it costs \$5 per ton to lay it on the dump.

HUMBOLDT.

SHEBA MINE, STAR DISTRICT.—*Silver State*, June 3d: Work is pushed, and the ledge continues to show ore of high grade. It is now sufficiently developed to prove, beyond a doubt, that the old Sheba is a permanent mine.

ECLIPSE MINE.—Work is going forward in the tunnel. They are now in 150 feet, making 10 feet a week.

BULLION.—The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$5,631.

REESE RIVER.

ORE FROM MONTEZUMA.—*Reveille*, May

31st: Two tons from the Henry mine, just worked at the Manhattan mill, yielded \$505 per ton. Two lots of half a ton each from the Lee Hope and White Fawn mines, also worked at the Manhattan, yielded, the former \$458.55 per ton, and the latter \$289.04.

SALE AT BELMONT.—Wm. Flagelex, one of the owners of the Monitor, which worked \$700 per ton, has bought 700 feet from two of his partners for \$15,000 cash.

WASHOE.

DANEY MILL.—*Gold Hill News*, June 1st: We learn that the water is now all out of the old works, and the drift south is progressing at a satisfactory rate. The average assay of the ore is a little over \$22 per ton, \$20 of which is gold—the balance silver.

STARTED UP.—The Rhode Island mill, after undergoing a thorough overhauling of its machinery, pans, etc., started into full operation once more this afternoon on ore from the Crown Point mine. The mill works splendidly.

OPHIR.—Same of 5th: The Co. last week cleared out the bottom of their new shaft, and commenced sinking deeper to prospect.

VIRGINIA CONSOLIDATED.—This Co. have drifted to within a little over a hundred feet of their north line, and the rock being softer, better progress is made. Their new south drift is now in sixty feet toward the Gould & Curry, and is driven at the rate of five feet a day. Promising quartz is encountered.

GOULD & CURRY.—*Enterprise*, June 1st: Good progress is made in the preparations for the further sinking of the main shaft. The arrangements for pumping the large volume of water anticipated are on a scale of great magnitude. The new wire rope is in place. This cable is five inches in width and half an inch in thickness; it is 1,600 feet in length, and weighs over three tons.

LADY BRYAN BULLION.—Same of 2d: We yesterday saw a lot of crude bullion from the Lady Bryan mine, which weighed 2,267 ounces—the product of the first run of the mill for rather less than 11 days.

WHITE PINE.

REVIEW.—*News*, June 3d: We went through the Original Hidden Treasure, yesterday, and were astonished at the amount of ore in sight. It is still a marvelously rich mine. Capt. Turner, Supt., has engaged the Swansea mill, and will commence shipping ore on the 10th. In the South Aurora there is the usual amount of ore in sight, but the Stanford mill, which has made so successful a run, will shortly shut down to make repairs. Ward Beecher proper stands about the same as in our last. Ward Beecher Consolidated is rapidly developing into a first-class mine. The Manhattan mill started up on tailings, but next week will be put to its full capacity on ore from the above mine. Several mines which have lain idle for some time, have started up and are shipping valuable ore. Among these we may mention Emersley, Charter Oak and Virginia; ore from the former two milling up into the thousands. The Trench mine continues to ship hase ore to the Big Smoky, which works \$300 nearly per ton; and the Republic, between Hamilton and Shermantown, had some ore worked, this week, at the Big Smoky, which went \$590.63.

WEEKLY SHIPMENT.—Wells, Fargo & Co. shipped, during the last week, from this city, bullion to the value of \$34,343.80.

Arizona.

BRADSHAW.—*Prescott Miner*, May 20th: Not a week passes that new discoveries are not made, and every foot sunk upon the Tiger, Eclipse, Cougar, Badger, Lion, Del Pasco, Hunter and other ledges, brings to view more rich ore. Scores of tents and cabins have been built, and the people number at least 300 men. One smelting furnace is in full operation, and a small mill will soon be erected.

WALKER DISTRICT.—Ten days since, Mr. Pointer brought to town \$1,400, the proceeds of 25 tons of ore just worked in an arastra. On Saturday last, C. Y. Shelton brought down \$840 in dust, and \$200 in specimens, which he had just taken from 2,500 pounds of Vernon ore. He has tunneled upon the ledge 165 feet; and has a two foot vein, in which the gold can be seen by the light of a candle. He thinks of buying the Eureka mill.

HASSAYAMPA.—Davis & Co. are working upon their lode, which is one of the largest and richest in the Territory. The vein is twelve feet thick. The croppings have been prospected for 4,000 feet, and free gold and silver found everywhere.

WICKENBURG.—Mill running and paying. Deep shaft on Vulture lode down

over 350 feet, at which depth there is abundance of rich ore.

Colorado.

The Herald of May 27th says: The Lexington mill is to be started up again next week, with the first Stephenson pan ever brought to this Territory. Messrs. Knox & Stephenson came on with the pan from the Pacific coast, and Mr. Knox intends remaining until the merits of the pan have been fairly tested on our ores.

Mr. Thomas Bates, the inventor of an improved ore reducing machine, designed for pulverizing ores on the Burr Stone principle, is building a mill in Nevada gulch, in company with his son. The burr-stones are 3 feet in diameter, and the upper stone is to make 225 revolutions per minute.

ITEMS.—Register, May 31st: Messrs. Bennett, Gray & Root have struck it on the Kansas, after a long time of discouraging toil. The crevice has "opened out wide," giving a splendid vein of rich pay rock.

TRAIL CREEK.—The Fredland lode, has been stripped on the surface for 2,000 feet. The first-class ore gives an ounce and a half gold, and 30 ounces silver per ton. There are now but two parties mining on the lode. There is piled out in all 200 tons of first-class, and about 125 tons of second-class ore. Specimens of native copper said to be from this lode are rich in gold. The ores of this lode have not been properly understood; but tests are now making, and Trail Creek may again take her place as a bullion district.

GEORGETOWN.—Miner, June 1st: The Baker M. Co. shipped last week one bar of silver bullion weighing 658 ozs., .788 fine, coin value \$670.37, obtained from ore from the Stevens mine. The Maine lode, lately discovered by Chas. Keeney, on Republican mountain, is yielding some magnificent ore. The Stewart Co. shipped last week silver bullion to the amount of \$4,332.18, coin. The work of connecting the Terrible tunnel with the shaft on the vein will soon commence. The Burleigh drill will be used. The lode where cut by the tunnel is yielding considerable ore. The Washington mill is concentrating ore from the Brown and Terrible mines, a large lot of which is on hand. Alps lode, in Cascade district, carries a pay vein of 2 1/2 feet of solid ore, which will mill 100 ounces in silver per ton.

Idaho.

ITEMS.—Avalanche, May 27th: Put Bradford's 10-stamp water mill on Sinkler creek is running on Surplus Oro Fino ore. Charley Hayer & Co. are working the Daniel Webster mine and have now 16 tons of ore ready for crushing. The shaft is down 20 feet showing a rich gold bearing vein 5 to 6 inches in width. Mickey & Co. are working the Empire, taking out good looking silver ore. Skookum boys have erected a whim and are working night and day. The shaft is down 160 feet. The ore, of which they have out 150 tons, is worked at their own astras. The McMahon Bros. have 50 tons of Red Mountain ore which will be worked immediately at the War Eagle mill. The upper shaft is down 75 feet where the ledge is two and a half feet in width. Sands & Co. have 50 tons of splendid looking ore on the dump at the Illinois Central. The shaft is down 75 feet from the bottom of which a drift has been run south 50 feet, where the vein is 20 inches wide and rich in both gold and silver. A company of tributaries have commenced work on the Poorman.

Montana.

PHILLESBURG.—Cor. of Helena Gazette, May 29th:—The St. Louis mill blew its horn this morning for the first time in several weeks, under the Professorship of Mr. J. Alger. Prof. Holland is the amalgamator. They are working ore selected by men who gathered it from the surface, and are well satisfied that it will pay them well for their summer's work after paying the mill charges. Brown, Launders & Co., on the Eastern Camanche, have run a tunnel eighty feet from discovery, and taken out several hundred tons of very rich ore.

SUMMIT.—Cor. of Montanian, May 25:—Col. Postlewaite's mill is running night and day, on "Keystone ore." About 350 tons await milling.

ARGENTA.—Work is progressing favorably on the Blue Wing, and other ledges, Bohm & Co.'s furnace is about ready to commence.

Silver Bow miners' meeting laid over all ground till next year, water being 40 cents an inch. A few of the richest companies are at work, So says the New North West of May 27th.

BLACKFOOT.—Independent, May 26th:—This place is one of the liveliest camps in Deer Lodge county. All the miners are

stuicing and have flattering prospects. Most of the companies are ground sluicing and will not clean up for several weeks. Kerr, McCoy & Co., at the mouth of Illinois gulch, have made two clean-ups this season, the aggregate result of which was \$5,000.

CABLE CITY is once more showing signs of life. The Cameron mill started up last Monday on better rock than ever.

GOON YIELD.—Mr. Porcher, of Silver Bow, informs us that Frank Gump cleaned up \$735 from four days' run, last week.

BLAKELY, BROWN & Co. have struck a bed of pay gravel on their claim at Pike's Peak, that prospects from one to fifty cents per paa. There is thirty feet of gravel that pays.

BEAUMONT.—Mel. McGee & Co. cleaned up \$2,500 last week, from their claim at the Top o' Deep.

STRUCK IT RICH.—Thos. Rutter writes from Highland that he has struck a rich quartz lode near that place, and that hands are scarce at \$5 a day.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

BELLE VIEW M. Co., Placer Co.—May 17th. Capital Stock, \$800,000 in 8,000 shares. Trustees: W. H. V. Cronise, A. C. Penchey, W. P. C. Stebbins, T. E. Baugh and J. F. Crosett.

STAR M. AND M. Co., Nevada.—May 19th. Capital Stock, \$2,500,000 in 25,000 shares. Trustees: M. J. McDonald, J. Greenbaum, F. K. Arnold, L. J. Lewis and G. Hearst.

BULLION M. AND S. Co., Nevada.—May 22d. Capital Stock, \$2,000,000 in 20,000 shares. Trustees: A. P. Hotelling, J. S. Stidger, E. D. Wheeler, A. P. Sutton and A. M. Craue.

Mining Stock Market.

[S. F. Stock and Exchange Board.]

SAN FRANCISCO, Thursday Eve., June 8.

The stock market has been rather weak during the past week. Amador has sold for \$290, \$277, \$275 and \$280. Eureka sold for \$68, \$66 and \$64.

The largest single transaction which ever occurred on this coast, it is said, took place this week after the annual meeting of the Crown Point company. The "mill" combination held 4,100 shares and A. Hayward held 6,300. There was some danger of a split between the two, but a compromise was effected, Hayward taking the 4,100 shares of the other party at \$300 per share. Such is the general account of the transaction.

The following table gives last Thursday's quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week:

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING MAY 23D.

PRINTERS' FURNITURE.—John Frederick Uhlhorn, Sacramento, Cal.

FASTENER FOR DOORS AND WINDOWS.—Jacob Z. Davis, San Francisco, Cal.

PRIVY.—Frank Riedel, San Francisco, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of notice:

OPERATING DRILLS.

A. Blatchly, S. F. We have previously described the valuable drill invented by Dr. Blatchly and spoken of the excellent results obtained by it. But the doctor is ever seeking to improve on the past. His present invention relates to improvements in the devices for applying power to rock drilling machines, whereby power at the surface (as the hoisting or pumping engine of a mine) can be applied to operate any number of drills on any level or in any shaft or chamber in the mine. The object is to obviate the many inconveniences which arise when the engines are directly attached to the drilling machines and form a part of them. At the same time, he claims to get many important advantages by his method. His invention consists also in the peculiar construction of a set of sliding bars, operating in combination with pulleys, gears, shafts and universal joints to partially adjust the machine; and in the construction of a cross-shaft, operating with a similar combination, to perfect the adjustment, so that the machine can be operated in all positions and at any angle; also in the arrangement of shafts, gears and pulleys, so that any required number of drills can be operated simultaneously in different parts of the mine from one engine or source of power.

DOVETAILING MACHINE.

—E. Heath, S. F. This improvement in dovetailing machines is more especially applicable to a former invention of Mr. Heath's, for which he obtained a patent under date of June 14, 1870. It consists of an improvement in the cross pieces or guides which serve to hold the boards in the proper position for forming the tenons and mortises, so that, by means of adjustable projecting stops or springs, any width of board can be quickly brought to its place ready for the saws.

AMALGAMATING THE PRECIOUS METALS AND PREVENTING THE LOSS OF MERCURY.

—J. S. Phillips, S. F. This invention relates to an improved process for preparing mercury for use in amalgamating the precious metals, both for the purpose of preventing loss of the quicksilver and for etripping the particles of the metals, which are being amalgamated, of the sulphurous coat or envelope in which they are frequently encased, so that the mercury can act upon them. It is also intended for the better covering of copper plates with mercury.

Editorial Notes Eastward.—5.

After my ride on the locomotive, I retired to a more comfortable resting place in the sleeping car. Here I lay for a while, listening to the regular heating of the wheels over the track, keeping time to our passage, and to the roar and crash as we rushed through the tunnels. I could reflect on the views which might have been seen, were not the blackness of night around us, of mountain lake and stream, yet contented with my comfortable position in the warm car,—all the more contented from my previous exposure.

I thought of the beauties and the sad, romantic story of Donner Lake, and of the

specimens may be obtained at American Flat, and still finer ones in the neighborhood of Aurora. At the south end of Carson valley, on the Aurora road, good specimens of chrysolite may be found. The precious or fine opal has never yet been found in the State, though the common and wood opal occur. Petrified wood is very abundant—in fact, whole trees may sometimes be seen, and some specimens are very beautiful and make very handsome cane-heads and seals, when cut and polished. In many places in the State geodes are plentiful, and nearly all of these when broken will be found to contain beautiful crystals of various colors. Besides the stones mentioned above there are fine quartz crystals, and many specimens of quartz containing gold and silver are to be seen in cabinets, which would make fine seals, if properly cut. In short, Nevada is

he held between the thumb and finger for this purpose, they may be pressed into the end of a stick of hard wood. This test will distinguish from most other minerals, but not from all, as topaz, sapphire, zircon, etc., will also cut glass.

But the diamond is the hardest of all substances, scratches all other minerals and is touched by none, and yields to no file. As it breaks with difficulty, it is sometimes tested by placing it between two hard bodies, as two coins, for example, and forcing them together with the hands. Such a pressure will crush a quartz crystal, but the diamond will only indent the metal. It will not do, however, to place the stone on an anvil and strike it with a hammer—as some have done on this coast—as the blow will crush any stone. The diamond is heavy and can be separated with the gold or platinum particles, if they occur together, by panning.

The most certain test lies in the peculiar form of the crystals. They are never long and slender, but always, to lay aside technical terms, approaching a spheroidal shape. The chief point is the curved edges, which in small crystals can only be perceived by the aid of a magnifying glass, but which are always present. It is, perhaps, rare to find a diamond with four curved faces, but such a circumstance places its identity beyond doubt. A common form is a solid with eight sides (octahedron) whose edges are cut off by narrow, interrupted, convex surfaces. Such interrupted rounded angles are sure signs of genuineness.

PALM LEAF HATS.—The only place in the United States where palm leaf braid is manufactured, is in Massachusetts, the principal towns where the trade is carried on being Amherst, Palmer, Barre and Fitchburg. The raw material is brought from Cuba to New London, Conn., in bunches of twenty-five leaves from four to five feet long. The bunches, placed on the stock end, are packed in the bleaching rooms and subjected for sixteen days to the fumes of brimstone. The leaf, after being bleached, passes into the hands of the splitters, and about one-third of the material is rejected. This waste, until recently, was useless, but is now sold as paper makers' stock for fifty dollars a ton, when delivered at the mills. The split leaves are now sent out into the country to be braided into hats and woven into webs for Shakerhodes. This work is done by the wives and children of the New England farmers, and large teams are constantly passing over the steep hills and into the most remote recesses of the country, carrying the raw material to be braided and bringing back the finished work. A large number of persons find employment in braiding, and nimble-fingered girls can earn as much as an adult woman. The pay is small, but odd moments, which otherwise would be disengaged, are devoted to this labor. Country merchants, it is stated, often take the leaf and put it out in the neighborhood, being satisfied with the increase of sales although they make no profit from the braiding.—*Philadelphia Ledger*.

GRASSHOPPERS have made their unwelcome appearance in some parts of this State and in the interior. A man in Utah is said to have invented a machine which catches the creatures by the bushel-basket and passes them between two rollers, after which they need no further attention.

LAKES IN ANDERSON VALLEY.
240 miles from San Francisco.

TUNNEL No. 12.

contrasting calmness of days on Lake Tahoe, which nestles under the snow-clad peaks whence it draws its life-supplies. But my thoughts grew indistinct, and with them mingled the ever-present monotone of the train, until I was surprised to find that daylight was creeping into the car and that I had been sleeping soundly for hours.

Ornamental Stones of Nevada.

Although neither diamonds, rubies, emeralds, or other precious stones have yet

not unlike the land of Havilah, mentioned in the good book—"And the gold of that land is good: there is bedellum and onyx-stone."—*Virginia Enterprise*.

Searching for Diamonds.

Several times persons have brought to us pieces of quartz crystals, enquiring whether they were diamonds. It is known that diamonds occur on our coast, although only very small ones, with one or two possible exceptions, have been found. Still,

DONNER LAKE, AND TUNNELS 7 AND 8.
245 miles from San Francisco—Alt. 5,939 feet.

STATE LINE.
276 miles from San Francisco—Altitude 5,100 feet.

been found in this State, many stones suited to the uses of the lapidary, from their hardness and beauty, are abundant. Jasper of every variety and shade of color is abundant throughout the State; carnelian is to be found in many places, and is quite abundant at Carnelian Bay, Lake Tahoe; agates are also plentiful at Lake Tahoe, at San Antonio, Nye county, at Aurora, and in many other localities. Fine moss agates are often picked up by prospectors in their rambles among the wild mountain gorges and over the stony table lands. Amethysts are quite abundant in the various mines upon the Comstock; those found in the mines at Gold Hill are the best. Garnets are to be found in Washoe county, near Steamboat Springs, but they are of an inferior quality. Chalcedony is to be found almost everywhere in the State. Fine

as it is very difficult for the unpracticed eye to distinguish the gem in its natural condition from quartz crystals or topaz, it is very possible that many a precious stone may have been passed by unnoticed. The diamond occurs of various shades and hues, as yellowish brown, green, blue and rose-red, the finest, however, being white (or colorless), and as it does not display its brilliancy in its rough condition, the unexperienced must test such stones as are suspected to be precious.

The first test is, as to whether the suspected stone will cut glass or quartz with its sharp edge. A diamond will do so readily. When the specimens are too small to

California Wagons vs. Eastern Wagons.

In considering whether our California mechanics can successfully compete with eastern mechanics in supplying the demand for farm wagons on the Pacific coast, let us first direct our attention to the materials with which both have to deal—or to the elements of expense which enter into the manufacturing of wagons wherever that business may be carried on. These are,—first, hard wood for all the running gear of the wagons, embracing all the wood used about the wagon, except that for the box. Second, soft wood for the box. Third, the iron, bolts, etc., for all parts of the wagon. Fourth, oil and paint. Fifth, coal, used in working the iron and fitting it to its place. Sixth, the labor.

We will consider each one of these elements of expense in the order in which they are above named. The first great fact that demands our attention is that we have but very little if any hard wood fit for use in wagons on this coast, and to obtain that hard wood for use here, we are compelled to go into the immediate neighborhood of our most formidable competitors and purchase it. Upon this fact our competitors rely, more than upon any other, to give them the advantage and success over us. That this fact is very much against our State, in a commercial point of view, is very plain. That we have to send, annually, large sums of money to the Atlantic States, to pay for hard timber used here in wagons and other agricultural machinery, is just so much against our general interest and prosperity, and just so much in favor of the general interest and prosperity of the States that obtain our trade in this line.

But does this general fact play any figure in the competition now going on between the California and the eastern wagon makers? Certainly not. Why? Because, if we go into the eastern hard wood country with the cash or with good and undoubted credit, we can buy lumber upon equally as good terms as eastern buyers. We can have all our hubs, spokes, felloes, tongues and all other parts of the wagons got out there at the mills, on the ground, with equal facilities and upon equal terms with the eastern manufacturer. It is true that after they are thus got out they have to be freighted to California at great expense. This, as we said before, must be charged to our general disadvantage, as a State, and not to the particular disadvantage of our wagon makers. For what difference does it make whether the California manufacturer pays the freight on these articles in a raw state, or the eastern manufacturer pays freight on them after they are in the wagon? This freight money in the end has all to come out of the consumer on the Pacific coast, and not out of the manufacturer, either here or there.

If this freight money be equal, taking the hard wood in the completed wagon as the standard upon which freight is to be paid, then certainly there can be no advantage for either of the manufacturers arising out of the location of that timber. If, however, the hard wood can be laid down here in the rough state, by which we mean in wagon lumber style, hubs, felloes, spokes and planks for the other parts of the running gear, so that the freight on that which actually goes into the wagon, is less than the freight on the wood part of the imported wagon, then the California mechanic has the advantage on this one point.

What are the facts in the case? The average freight on hard lumber from New York and other sea ports of the East to San Francisco, is $\frac{3}{4}$ of a cent per pound. Being shipped in a rough state, as above indicated, there is freight paid on a considerable amount of lumber that is wasted in the manufacture. Suppose this waste to be equal to one-fourth of the lumber ship-

ped for each wagon, then the freight on the lumber actually used would be increased to one cent per pound. This calculation is based on the water route by the Horn. And we suppose that it will cost no more, aside from the purchase money, to place eastern hard lumber at the sea board, than it will to place western hard lumber at the shops of the western manufacturers—our real competitors. Then our next inquiry is as to the freight overland,—the route the imported wagons come.

The Studebaker company get their cars from South Bend to Sacramento and other principal points in the State at \$450 each. Each car brings about eight tons in weight on an average. This makes the freight on these wagons come at an average of two and a half cents per pound. Then the freight on the lumber actually used in the imported wagons, costs the eastern manufacturer one and one half cents a pound more than the freight on the lumber actually used in the California-made wagon costs the California manufacturer.

Allowing the wood work of the average farm wagon to weigh four hundred pounds, the California mechanic has, on the item of freight on hard wood alone, \$6 advantage on each wagon over the eastern manufacturer.

On the second item of expense, soft wood for boxes, there is no difference, since the boxes for all the wagons are made here.

As to the third item of expense, iron, we will next inquire.

The English refined iron is the kind mostly used in farm wagons manufactured in California, and the price of this iron regulates the price of American iron of similar quality throughout the United States. We will take this kind of iron then as a basis. This iron comes direct from London and Liverpool to San Francisco, and the freight on it, from those ports to San Francisco, is the same as to New York. This advantage in favor of San Francisco (the distance being greater than to New York), arises from the fact that it is brought here as ballast, in vessels taking grain. We have a little more interest, insurance and other expenses to pay in laying this iron down in San Francisco, than do the New York importers in laying it down there, making the actual cost in San Francisco about one-fourth per cent. greater than in New York. As against this, we may place the freight to the western manufacturers, from New York to their shops, so that as to the expense of this item at the shops of the California and Chicago or South Bend manufacturers, there is no advantage on either side. But after the South Bend or Chicago manufacturer has put the iron into his wagon, he has to pay two and one-half cents a pound freight on it to California, to place his wagon in the California market by the side of the California-made wagon. If the average weight of the iron on a wagon is 400 pounds, it will be seen that the California mechanic has an advantage over his eastern competitor, on the item of iron, of 10 dollars on each wagon. Add this to 6 dollars, the advantage in his favor on the freight of the lumber, and we have 16 dollars on each wagon in the California mechanic's favor. The other three items of expense—paints, coal and labor, we will consider in our next.

FINE ARTS.—The very liberal premium list offered by the State Agricultural Society in the department of fine arts is likely to bring out the finest exhibition of pictures ever made on the Pacific coast, at the State Fair this fall. Judge Crocker has consented to place on exhibition, at the Fair, the large collection of paintings purchased by him in Europe. This very expensive collection contains some of the finest and most valuable paintings in the world. The picture gallery will be one of the most interesting features of the Fair and will afford a rare opportunity to the lovers of fine arts to gratify and cultivate their taste.

An excellent suggestion is made by an English druggist in relation to the dispensing of poisonous substances. He proposes that, in addition to the word "poison," the labels should have printed on their margin the appropriate antidotes for each class of poisons. A bottle containing a mineral acid, for instance, would have on its label, "Poison!—If taken by accident, give (mixed with water) chalk, or soap, or whiting, or ceiling scrapings."

GOOD HEALTH.

Prevention Better than Cure.

[Written for the Press.]

Health is a necessary condition to happiness, and attention should be given to preserving rather than regaining it—our chief aim should be how to prevent rather than how to cure disease.

Let us take consumption. In the highest schools of medicine known, those of Paris, the principal advance lately made is the use of hypophosphite lime and soda to counteract or prevent the formation of tuberculous matter in the lungs. Now it can be proven that by excluding improper food, such as pork, milk, alcoholic preparations and all extraneous excitants; and using very little liquid at the time of eating, thus exciting the salivary glands to their highest state of efficiency; in fact, bringing out the national hypophosphite secreted by that important organ—the first step is taken to prevent consumption.

The age of man should average a hundred years, and he should be able to continue in active usefulness up to that period of life. The human race is capable of being brought up to that standard within a few generations; natural laws are wonderful in this harmony, and efficiency—the evils of diet are corrected, temperance and virtue fostered, man cannot long remain the puny creature of the present day.

Let us then be more agrarian, more Christian, more manly, and instead of wasting our energies in building cities, or in other words, hot houses to produce disease of body and mind, let us be satisfied with less of outside show, fashion, luxury; and cultivate—at the same time that we are cultivating our fields and gardens—a condition of health and contentment. If our suggestions as to the way to prevent consumption, are considered as food for reflection, we may offer others more full and explicit, about the way to prevent or cure some other of the more fatal diseases.

F. M. SHAW.

Fruit Instead of Medicine.

There is no doubt but that the free use of good fruit is highly conducive to health, and indeed almost indispensable to it. Much of the sickness in the western country is occasioned by the want of it. It is the great scarcity of it that creates such a demand for physic in our western country. The various fevers and bilious disorders prevalent in the summer seasons are more owing to the want of it than to any other cause. And not until fruit is generally cultivated, and used as an article of diet, shall we be rid of those disorders which are sapping the life fountains of thousands of our farmers annually. And if fruit were administered in many cases as an article of medicine, instead of the physician's prescription, we have no doubt it would be far better for the patient.

Nature in this, as in all other respects, has bountifully supplied us with varieties which, if properly cared for, will enable us to enjoy a succession throughout the year. But fruit is not only a necessary of life, but it is one of its great luxuries. What is more enticing to the palate than luscious fruit? And as an article of diet nothing equals it. It is easily raised, costs but little, promotes health, and is liked by everybody. Most people content themselves by cultivating two or three varieties. This should not be so. Fruit is more needed throughout the summer season than almost any part of the year. And the varieties which ripen at this time are least cultivated. The farmer cannot take a step which will add more to his own joys, and those of his own family, than by having such a succession as will furnish him the entire year.

First on the list in the spring time comes the delicious strawberry. But a little spot is required for its cultivation for the use of the family. Its healthful qualities are well known. Cities well supplied with it are remarkably exempt from diseases while the strawberry season lasts. We have accounts of wonderful cures effected in ancient times by its use. There are many varieties, but it is not our purpose to note the best of them at this time.

Next in order comes the raspberry, a most excellent fruit, and indispensable to every family. Then follows the blackberry,

the cherry, currants and gooseberries. Then comes the apricot, the peach, the nectarine, and the plum. Apples and pears, also commence ripening early in the summer, and the winter varieties, if properly stored, may be kept till the appearance of fruit next season. Who will not have this succession? How much it could add to homo happiness.

The above writer overlooks the grape, which in many countries is one of the most abundant and cheapest of all small fruits, while it is healthy in all.

Don't Rock the Cradle.

If all the ultimate consequences of one's acts are to be laid to his charge, the man who invented rocking-cradles for children rests under a fearful load of responsibility. The downright murder of tens of thousands of infants, and the weakened brains of hundreds of thousands of adults, are undoubted results of this invention. To rock a child in a cradle, or to swing him in a crib, amounts to just this: the rapid motion disturbs the natural flow of the blood, and produces stupor or drowsiness. Can any body suppose for a moment that such an operation is a healthful one? Every one knows the dizzy and often sickening effect of moving rapidly in a swing; yet where-in does this differ from the motion a child receives when rocked in a cradle? It is equivalent to lying in a ship's berth during a violent storm, which sickens nine people out of ten. A very gentle, slow motion, may sometimes be soothing; though always of doubtful expediency; but to move the cradle as rapidly as the swing of a pendulum three feet long—that is, once in a second—is positive cruelty. We always feel like grasping and staying the arm of the mother or nurse who, to secure quietude, swings the cradle or crib with a rapidity equal to that of a pendulum a foot long. If any mother is disposed to laugh at our suggestions, or consider them whimsical, we beg of her to have a bed or cot hung on cords, then lie down in it herself, and have some one swing it with the same rapidity that she allows the cradle to be rocked. What she will experience in both head and stomach is just what the infant experiences.

We insist that this rocking of children is a useless habit. If not accustomed to rocking they will go to sleep quite as well when lying quietly as when shaken in a cradle. If they do not there is trouble from sickness, or hunger, or more likely from an overloaded stomach; and though the rocking may procure a temporary stupor, the trouble is made worse thereafter by the unnatural meanstaken to produce quiet for the time being.

Sound Sleep.

Any man who can bound out of bed as soon as he wakes of a mid-winter's morning, is worth something. No fear of his not making his way through the world creditably, because he has the elements of a promptitude, decision and energy, which guarantee success. To invalids we make a comfortable suggestion worth knowing. If you have force of will enough to keep you from taking a second nap—and it is the "second nap" which makes its baneful influence felt on multitudes—it is better for you to lay awhile and think about it, until that feeling of weariness passes out of the limbs which you so commonly feel. But to sleep soundly and feel rested and refreshed when you wake up of a morning, four things are essential: 1. Go to bed with feet thoroughly dry and warm. 2. Take nothing for supper but cold bread and butter, and a single cup of tea of any kind. 3. Avoid over-fatigue of the body. 4. For the hour preceeding bed time, dismiss every engrossing subject from the mind, and let it be employed about something soothing and enlivening, in cheerfulness.—*Hal's Journal of Health.*

HOW TO ADMINISTER RAW MEAT.—It has lately become quite common to recommend raw meat for diet for certain maladies, and the London *Lancet* gives directions for its manner of administration, as follows:—"The fillet should be preferred, as being the most delicate and the richest in muscular fibrin. It should be freed with the utmost care from fat and tendon. It should be finely minced, and then brayed in a mortar of wood and stone. When reduced to a paste it should be covered with sugar, gluten, or vegetable gelatine, to overcome the repugnance with which it is at first naturally regarded. Some prefer to squeeze out the juice, and swallow it mixed with a little orange-water, etc., whilst others again make it into houses, and take it in slightly warmed beef-tea or soup."

The Miners' Strike.

On June 1st, the miners at Sutter Creek, Amador county, struck in all the mines of the district, closing them up and allowing no one to work until at least \$2.50 per day should be paid for wages. We hear of no actual violence done. The Amador company refused to make the concession demanded and affairs are now at a dead lock.

We are extremely sorry that any such occurrence should have taken place. Now that it has occurred, we see but one way by which the affair can be settled without bitter feeling, and that is the method lately tried successfully in England and the East,—arbitration. Delegates from both parties should meet to arrange the matter, if possible, and, if not, to leave the decision to a referee chosen by both sides, by whose decision all agree implicitly to abide.

The employers have no right to grind down the workmen, and the employees have no right to dictate terms to the employers or prevent others from free action. A strike results always in a loss to both parties. The question to be decided is, what is a fair remuneration for the labor? The answer can be obtained only in the manner indicated above.

THE DIAMOND DRILL AT SMARTSVILLE.—We are assured that the comparison between the diamond drill tunnelling machine and hand labor was really much more favorable to the former than we stated last week. We then said that with hand labor and black powder the cost of mining in the tunnel per foot was \$40, and the average daily progress was one foot. This was true for the total average of the tunnel, and with *giant powder*. But for the last 200 feet, where the hard rock was met in which the machine worked, a daily progress by hand drilling, less than 10 inches was made at a much greater cost per foot. The machine makes in this, as then stated, 2.6 feet per day, at a cost of \$24 per foot.

THE Sonoma and Marin District Agricultural Fair will be held on the 25th of September.

Railroad Progress.

Washington Territory and Oregon.

The Northern Pacific is being pushed with energy. The road is rapidly advancing at the eastern end. The first spike of the Pacific division was driven on May 16th, at Kalama, W. T., and grading, track-laying, etc., are progressing actively. The contract for grading 25 miles from Kalama towards Puget Sound calls for the completion of this in October. The route of the road is still a secret. The citizens of Walla Walla have been active in their endeavor to have it run through their place. At least, it was stated that, per agreement with the N. P., they paid to have a survey made with this view, from their city to Wallula, on the Columbia River, 31½ miles. This showed the whole fall between the two points to be 600 feet; heaviest grade, 69 feet; estimated cost, \$21,271 per mile. The W. V. Union, of May 27th, publishes the report of the survey, which is to be laid before the N. P. Co., although the line would appear to be only a feeder.

On the Oregon and California Railroad work has also been progressing, the track being completed to the Calipoya river, 10 miles south of Alhany, on April 14th. On April 28th, construction trains were running to the one-hundred mile stake. The citizens of Eugene City and of Harrisburg have been troubled lest their places should be left one side of the line, and are raising money to have it run to them. Holladay agreeing to accommodate them if they would subscribe \$60,000; Eugene City had raised \$10,000 by April 18th. The reported junction with the new California Pacific Extension Eastward has given rise to fresh conjectures, but as two connections are given, it would appear that the interests of Southern Oregon will still be subserved.

The Portland City Council has appropriated \$5,000 towards the survey of the Portland, Dalles and Salt Lake R. R. The narrow gauge road from Yaquina Bay to Corvallis, on the Willamette, is still talked of. Surveys are to be made immediately by the Columbia River and Willamette R. R. Co., for a line from Salem to the Columbia, as a feeder, it is said, of the Northern Pacific.

California.

Work has not yet re-commenced on the California and Oregon R. R. We have already spoken fully of the new route through the northern counties, Oregon and Idaho, connecting the California Pacific and the U. P. R. R.

THE CALIFORNIA PACIFIC has been very active. It has purchased the Sacramento line of boats. It consummated on April 13th the purchase of the S. F. and Northern Pacific R. R., from Donahue's Landing to Santa Rosa, Sonoma county, 31 miles; and on May 7th commenced grading on this end of the connecting line from Adelante (junction of the Sacramento and Napa Valley branches), passing within a mile of Sonoma to Petaluma; and the northern end was finished on May 6th to within six miles of Healdsburg. Early in May the gauge of the Oroville road was changed to conform to that of the California Pacific.

SAN JOAQUIN VALLEY.—Several months ago, Stockton and San Joaquin county voted \$500,000 in bonds, payable on completion of 25 miles of road, to the Stockton and Visalia R. R. The legality of the action was questioned, but was lately reaffirmed by the Supreme Court. But since the vote the C. P. R. R. has built the San Joaquin Valley R. R. south (from Stockton) to Modesto, and the Stockton and Copperopolis road has been completed by the California Pacific R. R. to Peters.

These facts have led the Stockton and Visalia company to make an arrangement with the Stockton and Copperopolis road, whereby they build from Peters to Visalia, and work on this line will be commenced soon. Material for it has already been forwarded. On the San Joaquin Valley road work is reported as recommenced about the first of the month. Thus, it would appear, there will be two competing lines up the valley from Stockton to Visalia.

About the first of April, a survey was commenced (since finished) of a branch road from Holden, on the Copperopolis R. R., to Ione, Amador county, via Linden. 29 miles.

CENTRAL PACIFIC.—This company has been running lines for a short route from Sacramento to San Francisco. The Vallejo Recorder says that four routes have been surveyed:—1st, Sacramento to Collinsville,

across the Sacramento river, to Oakland; 2d, Sacramento to Benicia, across the Carquinez Straits, to Oakland; 3d and 4th, two lines via the "Middle Ground" below the junction of the Sacramento and San Joaquin rivers. Another line has been reported from Sacramento to the head of San Pablo Bay, via San Rafael, to Sausalito.

It has been said that the Central and the Southern Pacific would soon commence improving the 60 acres of submerged land in Mission Bay, San Francisco, granted by the Legislature for their terminus.

SOUTHERN PACIFIC.—Work was commenced, on April 13th, from Gilroy to the Pajaro River, 5 miles, and also at Hollister, 16 miles further south, with 500 men. Construction trains were running across the Pajaro on May 4th. The section of 20 miles must be completed, according to legal requirements, by July 1st. The work will then go on more slowly, it is said, the law requiring only 20 miles per year.

The amended incorporation of the company, filed May 15th, mentions three lines of road: 1st. (main line.) S. F., through counties of San Mateo, Santa Clara, Monterey, Fresno, Tulare, Kern, San Bernardino and San Diego, to the Colorado River, 720 miles. 2d. (Branch.) Tehachepa Pass (Kern county) via Los Angeles, to Texas Pacific Road, at or near the Colorado River, 324 miles. 3d. (Branch.) Gilroy (Santa Clara county) through Santa Cruz county to Salinas, Monterey county, 45 miles.

The Kern County Courier, of May 27th, says that land has been withdrawn for the railroad which has filed a map showing its route, which is, after crossing the Tulare Valley, via Tehachepa Pass, Soledad Pass (Los Angeles Co.), San Geronimo Pass (San Bernardino Co.), Chahuilla Valley (San Diego Co.), to Fort Yuma.

Overland Roads—New Projects.

The Texas Pacific has organized at the East and is reported active. A telegram says that the Atlantic & Pacific road was in running order, on May 25th, from St. Louis to Grand River, Indian Ter., some 500 miles, and graded 20 miles beyond. The *Atla* says that the directors of this road, to run to about the 35th Parallel, are to come out here soon. According to these and previous statements and rumors, we are to have five grand overland routes to this coast, as follows:

1. Northern Pacific. Lake Superior to Puget Sound.
2. U. P. R. R. and California Pacific.
3. Central Pacific and extension eastward.
4. Atlantic & Pacific, along the 35th parallel.
5. Texas Pacific, along the 32d parallel.

In this connection we may mention a late statement of the San Joaquin Republican, which predicts that the extension of the U. P. west will be, not via Idaho and Oregon, but south of the C. P. to Stockton, connecting, not with the Cal. Pacific at Davisville, but with the Stockton & Copperopolis (under the control of the Cal. P.).

Besides the new roads alluded to above, several others are still the topic of conversation. The Nevada, Grass Valley & Marysville are considering Mr. Harris' report. A party started out, sometime ago, to survey a line for a narrow gauge road along the coast, from S. F., via Santa Cruz, San Luis Obispo, Santa Barbara, San Buenaventura, Los Angeles and San Diego. The *Pajaronian* reported the party at Watsonville, Santa Cruz county, on May 27th.

A contract is reported let to Gen. Banning for 50 miles of a line from Los Angeles to the coast. The survey of a road from Santa Cruz to San José was commenced April 19th, and completed May 26th. The Oakland Central R. R. Co. was incorporated June 2d; object, to build a road from Oakland to San Pablo, 12 miles. It is also proposed to build a road in Humboldt county from Hookton to tide-water on the Eel River.

Of the Antioch & Visalia, and S. F. and Menlo Park (narrow gauge) roads we have heard nothing lately.

Nevada—Utah—Colorado.

Of the Nevada narrow gauge projects, only two have been heard of lately. The Reno & Virginia City has been surveyed and located, as has the Elko & Hamilton. Of the Unionville & Mill City, and the Palisade, Eureka & Hamilton, we have no account.

Work on the extension of the Utah Central from Salt Lake south was commenced May 9th. The first spike was driven by Brigham Young on June 6th.

At the beginning of May, the charges for freight were raised on the U. P. and the C. P. roads. This seriously affected the inte-

rior for the worse, and it is to be hoped that the old rates (at least) may be re-adopted.

In Colorado work is being pushed on the Denver & Boulder Valley road and the Denver & Rio Grande. The citizens of Central City and of Georgetown have been taking active measures to get roads built to their respective places.

Gold Mines Near the Calaveras Big Trees.

There is no mining field which offers greater inducement for the investment of capital than the western slope of the Sierra Nevada. The wonderful productiveness of such mines as the Amador and the Eureka in the great depth reached, the late successful working of claims formerly abandoned as worthless, and the discovery of other rich lodes, are bringing the auriferous quartz veins of this region into prominent notice.

A recent discovery near the Big Trees in Calaveras county is likely to take rank among the first mines of the State. The veins here present many striking features of interest, and seem to answer in the fullest degree the definition of true fissure veins, "fissures proceeding from indefinite depth and filled from below, by chemical processes, with matter differing in nature from the country rock." Like many of the most noted veins of the world, they occur in fissures which have been opened in the earth's crust by the rending asunder of the rock formation across its stratification.

The country rock is slate. This contains numerous dikes of traps, porphyritic greenstone, etc., occupying fissures which run transversely across the slate. The igneous character of the dikes denotes that these rents extended down to the fiery interior of the earth. The gold bearing lodes are found in precisely the same kind of fissures, which is certainly suggestive of their origin. Moreover, the nature of the deposits denotes that they were formed under conditions possible only in fissures extending into the deep interior of the earth, and hence comes an assurance of their permanency.

There are here several parallel fissures, nearly vertical, having a course of N. 40° E., with very solid and smooth walls, and from 5 to 12 feet wide. In these occur the quartz veins, the quartz occupying only a portion of the space (3 to 9 feet) the balance being filled by an accompanying vein matter differing from the country rock, and not found outside of the fissure walls. The whole of this vein matter is full of base metals, particularly the sulphurets of iron, deposited in a way that indicates a previous state of solution or possibly vapor; for besides being disseminated throughout the body of the rock, the faces of broken pieces, which had no seams visible to the eye, are often found coated with particles of metal, forming flakes that can be removed with a knife blade.

All of this material contains some gold, but the pay rock proper occurs in chutes of a peculiar kind of quartz which is held by many of the miners to belong to the true chimneys of the precious metals. It is so thoroughly impregnated with the various base metals, especially the sulphurets of iron, lead and zinc, that not an ounce of it can be found destitute of these. The gold is diffused in fine particles through the ore, as if an element of its composition.

The ore of these lodes is of high grade. The Calaveras Gold Mining Company, whose mines are situated here, lately had five tons, taken as an average sample from a dump of several hundred tons, worked in the Angel Co.'s mill, and obtained a yield of \$50.80 by simple treatment in a wet battery. The company own three lodes, all situated convenient to one mill, with abundance of pure water and an inexhaustible supply of timber near the mines. They are now erecting a 20-stamp mill, which will be finished about the first of July.

Much the larger number of gold-bearing quartz veins throughout the mining region belong to the pocket class. In these there are no regular paying ore chutes. The gold they may contain seems an accidental deposit. As a rule such do not pay to work. But they are said to be easily distinguished from the former class by the absence of the base metals and by the appearance of the quartz.

Our New York Office.

The steady increase and extension of our business has rendered it desirable that we should be locally represented in the Eastern States, and we are now pleased to announce that Mr. Dewey has established our "New York Office" at No. 37 Park Row, (Room 25) in charge of Mr. W. E. Partridge, editorial and business correspondent for this journal.

Mr. Partridge is an excellent writer, of considerable experience, on practical, scientific and industrial subjects, and will favor our readers with the freshest and most important information from the Eastern States, regarding new inventions and all industrial matters of special and general interest to our particular class of readers.

He will also attend to all business matters which may be more conveniently transacted with him by our Eastern patrons, having full authority from us to do so.

Academy of Sciences.

The regular meeting was held on Monday, Mr. G. H. Bloomer presiding. Various contributions to the cabinet were received,—dried plants from England; nine species of grasses, genus *Stipa*, three of which were new, from Prof. Bolander; etc. Dr. Cooper presented a paper on the shells collected by Mr. H. Hemphill in the adjoining States and Territories.

Prof. Bolander read a communication from Prof. Asa Gray, of Cambridge, inquiring about the intended invitation of this Academy to the American Association for the Advancement of Science. Dr. Cooper stated that an invitation had been extended, but to set all doubts at rest, it was unanimously resolved that the American Association for the Advancement of Science be invited, by this Academy, to hold their annual session for 1872 in the city of San Francisco. Mr. H. Heyneman advised the propriety of requesting the Chambers of Commerce and other bodies of the city to unite with the Academy in the invitation, and it was resolved that this question be discussed at the next meeting.

THE COLUMBIA CO-OPERATIVE FOUNDRY Co., incorporated last March, has started work at 133 & 135 Beal street. They pay particular attention to castings for mills and house-fronts, and we commend them to the attention of our readers. They are now putting up the castings for a large building on New Montgomery street, extending from Howard to Minna, for the Montgomery Real Estate Co., and we hope to hear soon that they are crowded with orders.

IMPORTANT DECISION.—On Monday, June 2d, Judge Stanley, of the County Court, delivered an interesting and important decision, declaring unconstitutional the Act of the Legislature, of March 26th, 1857, which authorizes the Harbor Master to collect tonnage on vessels entering the port. The tax has been a heavy burden and the decision will be hailed with general pleasure.

ENDLESS WIRE ROPE-WAY.—A working model of Hallidie's Endless Wire Rope-Way has been set up in the store of A. S. Hallidie & Co., 519 Front street, where it has been seen in operation by very many persons. The general opinion is that it will work well, and the general opinion is undoubtedly correct in the present instance.

BLUE LAKE WATER PROJECT.—The *Calaveras Chronicle* says that work will soon be commenced on the canal of the Blue Lake Water Company, and that contracts have been let for digging a considerable portion. The canal is to be 4 feet deep, 10 feet wide at the bottom and 16 feet wide at the top.

EARTHQUAKES are mentioned at the East and elsewhere. An earthquake and volcanic eruption on an island in the China Sea destroyed 600 lives.

The Eclipse of 1870.

Of all astronomical phenomena none can compare with a total eclipse of the sun for grandeur and for effect on the mind of man. We know from the history of the world what the effect has been on the human race, how it has caused first fear and reverence, then wonder and a strong desire to investigate into the reasons and concomitants of so extraordinary an appearance.

As each eclipse has occurred, the scientific world has given to it more and more attention, for the occasion gives opportunity for investigating matters which are, at other times, difficult to examine. Probably no such extensive preparations have ever before been made as were taken for the eclipse last year, and although we have noted the results from time to time, yet a

Jaansen, who left Paris, then besieged, in a balloon.

The Americans at Sicily and Spain were the most successful, although not entirely so. The English party were wrecked, but still were able to take some observations. The French savant reached Algiers only to find the day so cloudy that he could see nothing.

The main object of all the expeditions was to investigate the nature of the corona, that halo of silver light of strange and varying forms, which has proved such an enigma to astronomers. Was it altogether a solar phenomenon, or was it only due to atmospheric influences, to diffraction or irradiation, or was it due to both, or was it only an optical delusion? Such were the questions to be answered.

To give an idea of the singular difference existing between drawings of the corona, we give the following illustrations. Fig. 1 is a copy of a drawing made by the Italian Professor Agnello, and Fig 2, that made by Dr. Mayer, of Burlington, Ver-

ECLIPSE OF THE SUN, DEC. 22, 1870.

general article on the matter will not be superfluous at the present time.

This United States took a prominent part in investigating the phenomena of the total eclipse of Dec. 22d, 1870. This eclipse passed southwesterly over the Atlantic, across the southern part of Spain, the north coast of Africa, through Sicily, to Greece and Turkey. Congress appropri-

ated \$29,000, and two expeditions were sent out from our country.

The Washington Observatory also fitted out an expedition. The English government was somewhat backward in the matter, but was finally induced, mainly through the efforts of Prof. Pierce of the U. S. coast survey, to furnish a man-of-war to carry observers to various points in Spain, Algeria and Sicily. Another expedition was fitted out by Lord Lindsey, a young English nobleman; and the French were represented by the eminent physicist,

mont, of the eclipse of 1868. They have been previously published in the *London Engineer*.

We cannot go into the details of what was done. These we have already published. Suffice it to say that the observations were of four kinds:—spectroscopic, photographic, polariscopic, and sketching with the naked eye or with the telescope. Various instruments of ingenious construction were devised to aid in the observations.

It was found that the corona is a solar phenomenon, and that there is what is supposed to be a new chemical element. It exists to a height of 50,000 to 150,000 miles above the sun's surface, shines partly by its own light and partly by the light of the sun. The atmosphere has at its lowest depth not more than one-twentieth the density of our atmosphere, yet sustains the weight of an atmosphere at least 50,000 miles high and attracted by the great mass of the sun. Such an elasticity denotes a tremendous amount of heat.

The amount of light during totality was measured. The existence of dark spaces in the corona was proved. Photographs and drawings were made and valuable observations. Until all of these are published, it is impossible to form exact conclusions; but enough has been done to show that man's knowledge concerning the great luminary which supports our life, is much more complete than it was before the hundred seconds of darkness fell on the face of the earth at 2 P. M. on the 22d of December, 1870.

MECHANICS' INSTITUTE ELECTION.—This took place last Monday evening. The ticket was elected without opposition as made out by the nominating committee. The seven Trustees chosen were as follows: B. P. Bruner, W. H. Williams, J. Wartenstein, J. R. Wilcox, T. Nelson, C. F. Bassett and H. W. Jones. The term of office is two years.

American Institute of Mining Engineers.

On the 15th of May, a convention of some of the leading mining, engineers and iron masters was held at Wilkesbarre, Pennsylvania, at which a permanent organization was formed under the above title. The convention held meetings during three days. Various papers were read and excursions made to various points of interest in the vicinity.

The object of the Institute, as then stated, is to encourage the free discussion of the various theories of mining and the exchange of the accumulated knowledge of engineers, superintendents and others in mastering the problems which are constantly presenting themselves; among which are included the consideration of more economical systems of mining coal and metals, improved methods of transportation above and below ground, the ventilation of mines, the mechanical preparation of coal and other minerals, the various metallurgical processes, and all other questions tending to the attainments of greater economy in the production of minerals and metals, and the greater safety and welfare of those employed in these industries. The by-laws adopted admit of three classes of membership: full members, honorary members, and associates. Every member must be a practical mining engineer or be in some way directly interested in the profession. A membership fee of ten dollars per annum is depended upon for revenue sufficient to meet the expenses of the institution, and any surplus funds which may accumulate are to be expended in the publication of such works of scientific and practical interest as the council may direct.

The following were elected officers:—President, David Thomas, Catasauqua, Pa.; Vice-Presidents, R. W. Raymond, New York; E. B. Coyes, Dufton, Pa.; W. R. Symons, Pottsville; W. P. Blake, Washington, D. C.; J. F. Blandy, Philadelphia; J. H. Swoyer, Wilkesbarre. Managers, R. P. Rothwell, Wilkesbarre; T. S. McNair, Hazleton, Pa.; G. W. Maynard, Troy; Raphael Pumpelly, Cambridge, Mass.; Thos. Petherick, Scranton, Pa.; T. M. Williams, Wilkesbarre; Thos. Eggleston, Jr., N. Y.; E. Gaujot, Pottsville; Fred. Prime, Jr., Easton, Pa. Secretary, Martin Coryell, Wilkesbarre, Pa. Treasurer, J. Prior Williamson, Wilkesbarre, Pa.

Evidently the movement has the support of the strongest men of the profession, and will undoubtedly prove highly beneficial to mining industry.

Toland Medical College.

The introductory lectures of the ensuing course at this institution was delivered last Monday evening by Prof. George Hewston, M. D. The college has been remodeled, has received very considerable additions to its cabinet, apparatus, etc., etc., has chosen a new Faculty, and now starts with renewed auspices. A large number of ladies and gentlemen inspected the arrangements on the evening named, and attended the lecture.

Dr. Hewston, in his lecture, touched briefly on the past, and spoke of the present of the college. He alluded to the duties of physicians to themselves and to society, and to the responsibility and grand objects of the vocation upon which the students were entering. He claimed superiority for the American system of medical education. He touched upon some of the points in which so great advance has been made in medical practice and to the grand discoveries within moderately recent periods. The lecture was excellent in substance, pleasantly delivered, clear and pointed, and altogether a model of its kind. It would indicate that the faculty possessed not only the requisite knowledge, but also the requisite ability to impart their knowledge to others.

Rev. O. P. Fitzgerald, State Superintendent of Public Institution, then delivered a short address. The regular course of lectures at the college commenced on Tuesday.

THE HYDE STEAM WAGON has arrived at Salt Lake City.

DOMESTIC ECONOMY.

Oysters in the Kitchen.

OYSTER SOUP.—Put two quarts of oysters, liquor and all, in a pan; set them on the stove to heat, but don't let them boil, or come very near to it; now drain all the liquor into your soup kettle, put in a pint of water and two quarts of new milk, half a pound of butter, a little whole allspice and pepper; have the oysters all this time where they will keep warm, add them and salt to taste; just as you are to serve the soup, break up some crackers fine and put into the soup before the oysters are put in. Salt should always be the last thing put in any soup, stew or fricassee, where milk is used, or it is apt to curdle. Oysters should never be boiled, but only scalded; it makes them tough and shrinks them all up; if they are to be stewed, heat them hot, but don't boil them. Always have the soup or gravy hot.

OYSTER STEW.—Put as many good oysters, with their liquor, as you think you will need, into a pan on the stove to heat, but not boil. Drain the soup into a sauce pan; as soon as it boils add half a pound of butter and some pepper; when this boils add a pint of cream and thicken a little with flour; after this boils up once, put in the oysters and more salt if necessary. Serve hot.

OYSTER PIE.—Line a deep basin with puff paste, fold a large towel and place inside to support the lid, then roll and ornament a piece of paste, the same as for a common pie; put on the basin and bake slowly; have an oyster stew made as above, without cream, and fill the basin as soon as the paste is done. Serve immediately.

OYSTER TOAST.—The same only no cream, thicken the juice a little with flour; when the stew is ready have a few slices of toast laid in a dish (well buttered), and pour the oysters into it. It is best to heat the dish hot that you put your oysters in to send to the table, as they are so much hotter than merely warm.

OYSTER FRITTERS.—Make a batter of milk, flour, eggs, cream of tartar, salt, salt in proper proportion. Don't make any thicker than for pancakes. Drop an oyster into each spoon of batter as you dip it out and fry in hot lard; brown well on both sides.

OYSTER STEW WITHOUT CREAM.—Make in all respects the same as with cream, only substituting half a pint of water for the cream. Many persons prefer oysters stewed in this way.

OYSTERS FRIED.—Drain the oysters well, roll in fine rolled crackers, and fry in hot lard and butter, two-thirds lard and one-third butter.

CONSOLING.—Housekeepers who groan under the burden of "Blue Monday," (wash day), will be glad to know that the process of washing in Europe, or in many parts of it, requires twice as much time as in the United States. In this country clothes dry far more rapidly. On the other hand bread dries very quickly in this climate, and a new supply has to be made with discouraging frequency. In Germany, housekeepers make up a batch of bread that lasts several weeks, keeping soft and fresh all the time. The greater dryness of our atmosphere is attributed to the prevalence of west winds, which instead of coming from the sea, as in Germany, sweep across great dry prairies, losing in the transit much of their moisture.

Eating Economically.

We copy the following highly valuable and interesting article from a medical work, thinking it well worth preserving:

What kind of food has the most nourishment and the least cost, is a question of great practical importance. The following tables may be studied with considerable interest by every family. They will show the mode of preparation, the amount of nutriment, and the time required for the digestion of the most common articles of food placed upon our tables. A dollar's worth of meat at twenty-five cents a pound, goes as far as fifty cents' worth of butter, at half a dollar a pound. Three pounds of flour, at eight cents a pound, is said to contain as much nutriment as nine pounds of roast beef, which, at twenty-five cents, is \$2.25; that is, twenty-five cents' worth of flour goes as far as nine times that much money spent for roast beef, as weighed at the butcher's stall. A pint of white beans, weighing one pound, and costing seven cents, contains as much nutriment as three

and a half pounds of roast beef, costing eighty-seven and a half cents. Of all the articles that can be eaten, the cheapest are bread, butter, molasses, beans and rice. A pound of corn meal (Indian) goes as far as a pound of flour; so that fine family flour at sixteen dollars a barrel, in New York city, in July, 1864, and corn meal at four cents, the latter is just one-half as expensive. If corn and wheat were ground, and the whole product, bran and all, were made into bread, fifteen per cent. of nutriment would be saved with much greater healthfulness. These are standard tables:

Food.	Preparation.	Nutriment. Per cent.	Digestion. Hrs & Min.
Cucumbers.....	Raw.....	2.....	3.30
Turnips.....	Boiled.....	4.....	2.15
Milk.....	Fresh.....	7.....	4.30
Cabbage.....	Boiled.....	7.....	4.30
Apples.....	Raw.....	10.....	1.15
Potatoes.....	Boiled.....	13.....	2.30
Fish.....	Boiled.....	20.....	2.00
Yeast.....	Boiled.....	22.....	1.30
Veal.....	Roasted.....	25.....	5.15
Leaf.....	Roasted.....	26.....	3.30
Poultry.....	Roasted.....	27.....	2.45
Mutton.....	Roasted.....	30.....	3.15
Bread, Wheat.....	Baked.....	80.....	3.30
Bread.....	Baked.....	80.....	3.30
Rice.....	Boiled.....	83.....	2.30
Butter and Oil.....	96.....	1.00
Sugar, Syrups.....	95.....	3.30

Cooking as a Science.

We heartily endorse the following from Moore's *Rural New Yorker*:

"If Medicine is a science, then Cookery is a science; and to tell the exact truth of the matter, the more important science of the two. If the science of cooking were advanced to the same degree as that of medicine, how very little need there would be of the latter! But alas! it is largely in the hands of the most ignorant women in the world. A few men have given their time and talents to the advancement of the science, and the gratitude of the race should be theirs.

Why must this science, so vital with interest and value, longer languish? Must women have the elective franchise before they learn to cook? Must they first learn to cure our ills, before learning how to prevent them? Must the title of M. D. be so immeasurably and falsely greater than that of C. D.? Are they to fold their hands and wait until men have lifted the science to high honor, usurped the domain themselves, and then moan because they are shut out of the science kingdom on account of unfitness?

It seems to us that now is the day and the hour for women to act in this matter. How many RURAL-reading women are willing to devote two or three years to the study of Cookery which must necessarily embrace chemistry, physiology and hygiene? It would be folly, indeed, to found a university for Domestic Science, if there be no active demand for one. Will not the enterprising young women who read this, digest the matter, and send us their thoughts in regard to it.

DRINKING BUTTERMILK.—Persons who have been in the habit of drinking buttermilk consider it disagreeable, because slightly acid in consequence of the presence of lactic acid. There is not much nourishment in buttermilk, but the presence of the lactic acid assists the digestion of any food taken with it. The Welsh peasants almost live upon oat-cake and buttermilk. Invalids suffering from indigestion will do well to drink buttermilk at meal times.

HOW TO COOL A ROOM.—Now that the hot weather is full upon us it may be interesting to be reminded that the simplest and cheapest way to cool a room is to wet a cloth of any size, the larger the better, and suspend it in the place you want cool. Let the room be well ventilated, and the temperature will sink from ten to twelve degrees in less than an hour. This is the plan adopted by many eastern nations.

POISON.—The house wife cannot be too careful in handling poison or in allowing it to be kept about the house. To prevent constantly recurring accidents, it has been suggested that arsenic and other poison, be put up by druggists in red paper and marked with the skull and cross bones, as is done in some parts of Europe, and that in fluid poison the same symbol should be put on the bottle. This the most illiterate could understand. Especially that skull and cross bones.

THE VALUE OF A COOKING RECIPE.—The Prussian Government, about the time of the breaking out of the late Franco-Prussian war, gave \$50,000 to a Berlin cook for his secret of making peas-pudding sausages that will not turn sour.

Domestic Receipts.

TO PRESERVE STRAWBERRIES AND RASPBERRIES WITHOUT BOILING.—A correspondent of the *German Town Telegraph* who has long practiced the method, recommends the following:—The berries should be picked when the fruit is dry, and put at once into a deep bowl or pan, and bruised gently. Mix with an equal weight of best "sifted" sugar, and put immediately into wide-necked bottles; cork these firmly without delay, and tie bladders over the top. Keep them in a cool place, or the fruit will ferment. This mixture should be stirred softly, and only just sufficiently to blend the sugar and the fruit. The bottles must be perfectly dry, and the bladders, after having been cleaned in the usual way, and allowed to become nearly dry, should be moistened with a little whiskey or alcohol on the side next the cork. I have thus successfully put up both strawberries and raspberries for future use for ice creams, or cakes or for tarts, without boiling.

HOME-MADE INK.—The ink made as described below is said to be beautifully black and flows freely, and does not in the least corrode the pen. It is far superior to the usual acid inks, which will spoil the best steel pen in a few hours' use. To five gallons water at boiling heat, add one-half ounce bicarbonate of potash, and one-half ounce prussiate of potash. Your ink is then made and ready for use. The cost is not more than fifteen cents per gallon.

A SWISS SOUP.—Boil three pounds of potatoes, mash them well and add slowly some good broth, sufficient for the tureen. Let these boil together, and some spinach, a little parsley, lemon, thyme and sage, all chopped very fine. Boil together five minutes; pepper and salt to taste. Just before taking it off the fire to serve, add two well-beaten eggs.

BUNS.—One pound of flour, one spoonful of baking powder, mixed well together; two ounces of lard, sugar, currants or seeds, one egg and a teaspoonful of milk. Make into buns, and bake immediately.

TO CLEANSE BLACK SILK.—Boil an old black kid glove till it begins to dissolve, strain the water, and sponge with it the right side of the silk; iron while damp on the wrong side.

Mechanical Hints.

TO MAKE A CONCRETE FLOOR.—The following recipe, supplied by a famous English authority, is quoted by the *Agricultural Gazette*, and may be useful to some of our readers:—"Three parts coal ashes (those from the blacksmith's forge to be preferred) and two parts gas lime from gas works, to be thoroughly mixed and then made into a mortar with gas tar. If the gas tar come from gas works where the ammoniacal liquor is not separated, it will be sufficiently mixed for the purpose; but if the latter be separated, and the tar be thick, it will set quicker if about one-fourth part of water be mixed thoroughly with the tar when used. For the floors of cow-sheds, this should be laid about three inches thick in one layer, on an even surface of gravel, or stone broken very small with a sprinkling of gravel over, and rolled down. The mortar may be laid on with a common shovel, and merely patted down flat. In dry, warm weather, if the mortar has been carefully made, the floor will set firm in a few days. For any ordinary out-house, half the thickness will make a permanent floor."

A WATER AND FIRE-PROOF CEMENT.—Water-proof cements for mending crockery, glass, etc., are not usually fire-proof; and fire-proof cements are not usually water-proof. The following, however, is said to be both:—Mix two ounces of milk with two ounces of vinegar. It will curdle. Separate the curd from the whey, and mix the latter thoroughly with the white of an egg; then add quick lime through a sieve until the mass is as thick as paste. The cement is then ready for use. A simpler cement or one more readily or easier made cannot be asked for.

DRIVING NAILS.—A Humoldt, (Kansas) paper says that city has the champion nailer in the world, in the person of Albert Minor, a lather by trade, and a son of Vermont. The paper adds that "Minor can drive more nails in one day than any other living man. He will drive nails faster than the fastest compositor can pick up type. He will drive sixty lathe nails a minute, ten hours out of the twenty-four, the year through, which would be 3,600 an hour, 36,000 a day, or 5,268,000 per day."

LIFE THOUGHTS.

HEAR as little as possible of whatever is to the prejudice of others.

BELIEVE nothing to the prejudice of others till you are absolutely forced to it.

NEVER drink in the spirit of one who circulates an ill report.

NATURE will always have her due; but whatsoever is beyond necessity is precarious and unnecessary.

ALWAYS believe that if the other side were heard, a very different account would be given of any matter.

MIND your business, and the public will commend you for so doing.

REMEMBER that drinking retards education, industry, and every branch of political and social improvement.

THE greatest pleasure I know is to do a good action by stealth and have it found out by accident.—*Lamb.*

No man will ever be poor who goes to himself for whatever he wants; and that is the readiest way to obtain riches, whether material or mental.

A FRIENDSHIP of interest cannot last longer than interest itself; and this is the reason why many in prosperity are to much followed, while he who is going down is without friends.

One Idea Men.

He who suffers himself to be wholly engrossed by one relation of life, soon ceases to be of value in any other. He loses the balance of character, and becomes one-sided and narrow minded. Business is naturally and rightly a means to many high and noble ends, and when thus followed it deserves all honor. But it is too frequently pursued as an end, and is to some the very essence of life itself. It takes the place of the very objects to promote which is its true destiny, and crowds them out by its own continual presence. He whose soul is always in his business grows unconsciously hard, cold and contracted in his views and feelings. His mind is closed against the light of truth, wisdom and intelligence; his heart is shut out from the warmth of domestic love and social sympathy. He pleads that he has no time for self-culture, for parental duties, for friendly intercourse, when the truth is that he ought to have no time for a business so engrossing as to crowd out these unmistakable duties. The truth is, that even business itself is better conducted by the man who resolutely lays it aside at regular intervals, and throws all his energies into other channels. The mind grows rusty by long confinement to one train of thought, and works less vigorously even on its favorite topic. Especially if one dwells much on the dark side of his affairs, and indulges in gloomy forebodings of ill, a weakness and timidity will ensue that will prevent the firm, prompt, energetic action which is so necessary to the successful prosecution of business. There is no doubt that many failures, and much of the ill success in the mercantile world, proceed from the pernicious habit of carrying the burden of business cares into hours from which they should be banished.—*Phila. Ledger.*

GREATNESS AND GOODNESS.—It is not possible for us to make our children great, but we can do much toward making them good. Great influences that we cannot understand, stretching over the whole span of our life, will make one man as great as a Mariposa redwood, and another as small as a dwarf-pear. Yet this, in its degree, shall be as good as that, while the sun will shine, and the rain fall, and the blessing of heaven rest on both. But the possibility is that the little one may become not only good, but great. Goodness of itself may be greatness, as it was in Washington and Lincoln; or there may be greatness without goodness, as the vast catalogue of mighty men who have been the scourge and curse of the race can testify.—*Robert Collyer.*

A DISTINCTION WITHOUT A DIFFERENCE.—When a rakish youth goes astray, friends gather to bring him back to the path of virtue. Gentleness and kindness are lavished upon him to bring him back to innocence and peace. No one would suspect he had ever sinned. But when a poor confiding girl has been betrayed, and receives the brand of society, and is henceforth driven from the ways of virtue, the betrayer is honored, respected and esteemed—there is no peace for her this side the grave. Society has no helping, loving hand for her, no voice of forgiveness. There are earthly moralities unknown to Heaven.

Tubular Kerosene Lanterns.

We offer you this remarkable Lantern now for the third season. Its success has been UNPARALLELED, and is THOROUGHLY ESTABLISHED. Last year over Twelve Thousand Dozen were sold, and this year the Demand is much Earlier and Heavier. You cannot take hold of it too confidently, and you can warrant your customers that it is Unqualified.

For Whiteness and Brilliance of Flame,
Economy in the use of Oil,
Freedom from Smoke or Smell,
Reliability in Wind and Motion,
Coolness of Burner and Oil Cup, and
Impossibility of Heating or Explosion,

For the Variety of Places and Purposes to which it is adapted, the Readiness with which it Sells, and the
Complete Satisfaction it Gives
to all who use it.

It works on a New Principle, and has created an entire Revolution in Burning Kerosene. It has perfectly overcome the objections which render all other Kerosene Lanterns, so Disagreeable, Unreliable, Wasteful and Dangerous.

Please favor us with your orders PROMPTLY, and oblige

The California Powder Works

No. 314 CALIFORNIA STREET.
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,
And BLASTING
POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives now in use, and the lifting force of the best blasting powder, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

16v20-3m JOHN F. LOHSE, Secretary.

MILLER'S TRUSSED PLATFORMS,
COMPRESSION BUFFERS AND AUTOMATIC COUPLERS, FOR RAILROAD CARS.

PATENTED MARCH 31, 1863, JANUARY 31, 1865, AND JULY 24, 1866.

Office—No. 231 Broadway, Rooms 4 and 5, opposite City Hall Park, New York.

The advantages gained by the use of these improvements may be briefly stated as follows:

- 1st. The platforms are held in a plane with the sills on the cars.
- 2d. The platforms cannot be broken by any ordinary accident.
- 3d. Telescoping is impossible.
- 4th. Any required compression may be attained, to prevent accidents by oscillation.
- 5th. No links and Pins are required, and no one is required to go between cars to couple them.
- 6th. The platforms may be held as close together as desired.
- 7th. By close coupling the train is shortened.
- 8th. They will not accidentally uncouple.

No Railroad Manager who comprehends the case fails to give these improvements a "trial," and all those who have tried them have adopted them.

- 9th. They may be uncoupled "without shutting off," to make a flying switch.
- 10th. They are strong; the train will not "break in two" at starting or while running.
- 11th. They cause the train to move steadily and not jerk in starting or stopping.
- 12th. They work well at great variations of height.
- 13th. They will couple with all kinds of "drawheads" and "couplers."
- 14th. They are cheap and durable.
- 15th. Injury to men when coupling cars is entirely prevented.

- 16th. Injury to persons by falling between cars is entirely prevented.
- 17th. Injury to persons and to cars by "telescoping" is entirely prevented.
- 18th. Injury to persons and to cars by "oscillation" is entirely prevented.
- 19th. The great steadiness of the cars, produced by compression, renders sleeping cars much more desirable.
- 20th. "Train Brakes" are rendered more valuable by the non-existence of "slack" in the train.

Prices of Materials, Etc.

Coupling Hooks.....	\$24 50 each.
Buffers.....	11 00 each.
Levers.....	2 00 each.

Patterns in Full Sets, or Single Pieces, for all castings used in the Improvements; and Templets, for Wrought Irons, AT COST. Drawings, Tracings, and superintendence of work are not charged for.

These articles will be promptly furnished and shipped to any part of the country on short notice. Orders must state what routes the goods are to go, and whether by express or as ordinary freight.

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsule are not used merely for the purpose of the ornament, but that they are serviceable in protecting the wine from injury, and insuring its genuineness.

BERRY & PLACE,
Importers and Dealers in
MACHINERY AND SUPPLIES.

SAN FRANCISCO, CAL.

Sole Agents in Pacific States for Sale of

Blake's Patent Steam Pumps,
Smith's Wood-Working Machinery,
Davis & Furber's Woolen Machinery,
The Swain Turbine Water Wheel,
Wood, Light & Co.'s Machinists' Tools,
Sturtevant's Pressure Blowers,
Hardy's Portable Drillers,
Dreyfus' Patent Self-Oilers,
Gardner's Safety Stop Governor,
Page's Belting, Etc., Etc.

We keep in stock the above, with a large variety of other Machinery and Small Tools.

Dreyfus' Patent Self-Oilers and Cylinder Cups.

A saving in oil of 75 to 95 per cent. guaranteed. No trouble of "oiling up!" No waste of oil! No oil cans needed!

by the use of the

NATHAN & DREYFUS
SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of

75 PER CENT OF OIL.

They are composed of a transparent Glass Cap, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.

Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

No testimonials are printed, but ask any one who has them what they think of them. Be sure you get Dreyfus'. Send for Circular and Price List to BERRY & PLACE, San Francisco.

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained, we feel justified in recommending it to all parties using Steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, swivels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. Thus

fully warrant the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either BLACK OR FINISH, as you may require. Send for Price List to BERRY & PLACE, San Francisco.

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages: First—Nothing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind. Second—Its great economy of both tallow and fuel. Third—It is self acting, and supplies the lubricating material only while the Engine is in motion. Fourth—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, and other crude contrivances, and allowing it to be in-tantly blown out at the exhaust (as must necessarily be the case), this Cup, by its peculiar action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the Cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

For further information, or Price Lists, address BERRY & PLACE, Importers Machinery and Mill Supplies, Warcoroma, 112 and 114 California street, San Francisco.

BLAKE'S PATENT STEAM PUMP.

These Pumps have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for simplicity, durability and power. Some of the advantages of the Blake Pump may be summed up as follows: It is positive under any pressure. May be run slow or fast, as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility having no cams, nor complex rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation. The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having no dead points, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used on Railroad and Steamboats; in Hotels; for Mining and Fire purposes; in Breweries, Tanneries, Sugar Pump on Exhibition. The agents have recently imported several of the largest sized Mining Pumps for water works, and deep mines, and will be pleased to refer parties to them: we claim for it, that it is the most simple and durable, and consequently the best Steam Pump ever built. For sale by BERRY & PLACE, Machinery Depot, 112 and 114 California st., San Francisco, who will be pleased to send circulars to any address, or show its advantages to parties calling on them.

Machinery.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and sellers for themselves, at the office, 239 Fremont Street, San Francisco.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber D. F is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before re-charging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the injection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and O.

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

STEAM JET PUMP.

Blakeslee & Williams' Patent—For
Water, Oils, Acids, Etc.

The best cold water pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start, it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Send for Circular. PARKER & HUNT,

Southeast cor. Tenth & K Streets, Sacramento City Cal.

7-30 GOLD LOAN

OF THE

Northern Pacific Railroad.

RAPID PROGRESS OF THE WORK.

The building of the Northern Pacific Railroad (begun July last) is being pushed forward with great energy from both extremities of the line. Several thousand men are employed in Minnesota and on the Pacific coast. The grade is nearly completed 265 miles westward from Lake Superior; trains are running over 130 miles of finished road, and track-laying is progressing at the rate of one to two miles per day. Including its purchase of the St. Paul & Pacific Road, the Northern Pacific Company now has 413 miles of completed road, and by September next this will be increased to at least 560 miles.

A GOOD INVESTMENT. We are now selling, and unhesitatingly recommend, as a profitable and perfectly safe investment, the First Mortgage Land Grant Gold Bonds of the Northern Pacific Railroad Company. They have 30 years to run, bear seven and three-tenths per cent. gold interest (more than 8 percent. currency), and are secured by first and only mortgage on the ENTIRE ROAD AND ITS EQUIPMENTS, and also on

23,000 ACRES OF LAND to every mile of track, or 500 Acres for each \$1,000 Bond. They are exempt from U. S. Tax; Principal and Interest are payable in Gold; Denominations: Coupons, \$100 to \$1,000; Registered, \$100 to \$10,000.

LANDS FOR BONDS. Northern Pacific 7-30's are at all times receivable at TEN PER CENT. ABOVE PAR, in exchange for the Company's Lands, at their lowest cash price. That is, in addition to their character as a first-class, prompt-paying Rail road security, these Bonds are in effect Land Warrants bearing a profitable rate of interest until exchanged for Homesteads, at TEN PER CENT. PREMIUM.

SINKING FUND. The Land Grant of the Road exceeds Fifty Million Acres, having an average soil of great fertility, in a climate that is simply unsurpassed. The Trustees of the Mortgage, Messrs. Jay Cooke and J. Edgar Thomson, are required to devote the proceeds of all Land Sales to the repurchase and cancellation of the Company's Bonds. This immense Sinking Fund will undoubtedly cancel the principal of the entire issue of First Mortgage Bonds (now selling) before they fall due. With their ample security and high rate of interest there is no investment accessible to the people, which is more profitable or safe.

EXCHANGING U. S. FIVE-TWENTIES. In view of the Government's expectation soon to call for the surrender of its outstanding 6 per cent. Bonds, under the present movement for funding the debt at lower interest, many holders of United States Five-Twenties are exchanging them for Northern Pacific Seven-Thirties, thus realizing a handsome profit, and greatly increasing their yearly income.

OTHER SECURITIES—AGENCIES. All marketable Stocks and Bonds will be received at their highest current price in exchange for Northern Pacific Seven-Thirties. EXPRESS CHARGES on Money or Bonds received, and on Seven-Thirties sent in return, will be paid by the Financial Agents. AGENCIES for the sale of this loan are established in nearly every city and important town throughout the United States and Canada. Full information, maps, pamphlets, etc., can be obtained on application at any agency, or from the undersigned.

For Sale by

JAY COOKE & CO.,

Philadelphia, New York and Washington, Financial Agents Northern Pacific Railroad Co. By Banks and Bankers generally throughout the country. mar25-13t-cow

The "PAIN KILLER" may justly be styled the great medicine of the world; for there is no region of the globe into which it has not found its way, and been largely used and highly prized. Moreover, there is no claim to which it has not proved to be well adapted for the cure of a considerable variety of diseases; it is a speedy and safe remedy for Burns, scalds, cuts, bruises, wounds and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, it is admirably suited for every race of men on the face of the globe.

It is a very significant fact, that notwithstanding the long period of years that the "Pain Killer" has been before the world, it has never lost a whit of its popularity; but on the contrary, the call for it has steadily increased from its first discovery, and at no previous time has the demand for it been so great, or the quantity made been so large, as it is to-day.

Another significant fact is, that nowhere has the Pain Killer ever been in higher repute, or been more generally used by families and individuals, than it has been here at home, where it was first discovered and introduced. That the Pain Killer will continue to be what we have styled it, THE GREAT MEDICINE OF THE WORLD, there cannot be the shadow of a doubt.—Providence Advertiser.

American Locomotive Engines.

The first locomotives made in the United States, were the Phoenix and the West Point, we are told, which were built at the West Point foundry, in 1830, for the South Carolina Railroad; and the third, the De Witt Clinton, for the Mohawk and Hudson Railroad, was completed in the spring of 1831. Two had been imported from England, one, in 1828, for the Carbondale and Honesdale Railroad in Pennsylvania, and another for the Mohawk and Hudson Road, in 1830. The fourth American-made locomotive was a miniature one, which, on April 25th, 1831, was set in motion on a track laid in the rooms of Peale's Museum, in Philadelphia, drawing two cars with seats for four persons. This little engine, which amused crowds of people, was the invention and work of Mr. Matthias W. Baldwin, a skillful and enterprising mechanic of Philadelphia.

Only a few years previous to these dates, the impossibility of economically propelling boats and carriages by steam had been clearly demonstrated to the satisfaction of learned societies, and the advocates of steam as a motive power had been heartily ridiculed. But Robert Fulton made a successful trip in his steamboat, the Clermont, on the Hudson River, in 1807, and, at the dates mentioned above, stationary engines had been in use in many parts of the United States. Still a locomotive engine was quite a curiosity.

In 1832, Mr. Baldwin received an order to build a locomotive for the Germantown Railroad company. This was a formidable undertaking. It is said that only one mechanic in America had yet succeeded in erecting a locomotive which would draw more than its own weight on a horizontal track. In the manufacturing city of Philadelphia only five mechanics could be found who could do any part of the work on a locomotive. No blacksmith could weld a bar of iron over 1½ inches thick, and no forge in the State could weld a tire, 5x1½ inches.

There was a dearth of tools. There were

no planing or slotting machines. The only contrivance for boring out a cylinder was a chisel fixed in a round stick of wood, turned by means of a crank worked by hand. Yet tools and patterns were made, and in six months, in November, the Ironsides was placed on the road.

But how queer that locomotive was in many respects. For instance, here is the advertisement concerning its work. "Notice.—The engine (built by Mr. Baldwin), with a train of cars will run daily when the weather is fair. * * * When the weather is not fair the horses will draw the cars." Engines were then hosed in wet weather, and horses rested on clear days.

with machines of endless number and variety.

Of the details of this huge establishment, which turned out, 1869, work of the value of nearly three and a half millions dollars, we have no space to speak. But the Baldwin engines are heard of everywhere,—in Germany, Cuba, Brazil, Peru, Canada—notwithstanding the competition of English manufactures, aided by cheap material and cheap labor. And with all the amount of work, so exact is everything conducted, and with such system, that if an engineer in Oregon should telegraph on that the piston-rod or cross-head of locomotive No. 2,300 was broken, a dupli-

put in and the flow has been regular from that time in quantity sufficient to furnish fuel for a large manufacturing establishment.

At the gas house the natural gas did the work of the ordinary fuel for the furnaces, small quantities of coke being supplied in addition now and then. In the retort house its illuminating powers were tested through about twenty pipes. It did not work well through the ordinary burners; but these being removed and full vent allowed to it, it gave all the light necessary; though a clear, steady light is not essential for the work to be done there. The light is not bright and clear like that of coal gas, and showed a liability to disturbance by the action of the atmosphere.

The company intend to have the value of the gas thoroughly tested, and have engaged the services of Prof. Hadley to make a scientific investigation of the matter. The subterranean gas is found all the way from Buffalo to Cleveland.

At Painesville, Ohio, between Erie and Cleveland, a well 550 feet deep is yielding an enormous volume of gas. This well is located about two miles from the Lake.

THE BALDWIN LOCOMOTIVE WORKS, PHILADELPHIA, PA.

But the Ironsides established the reputation of its builder. Before the close of 1834, he had completed five engines. And the business grew ever until the Baldwin Locomotive Works were able to claim to be the most extensive locomotive establishment in the world, and from the capacity of two small engines in a year, attained the capacity of one a day, or over three hundred men make a locomotive engine in a day,—boiler, cylinders, frame, driving wheels, truck, stack, cab, pilot and tender complete,—with the speed of forty miles an hour, and the power of a thousand tons.

Mr. Baldwin died in 1866, but the business of the "Baldwin Locomotive Works" is still carried on by the firm of M. Baird & Co. The old shop, erected in 1834, still stands, but around it has grown up the huge establishment, of which the engraving shows a part. On North Broad street, in an area of 240,000 square feet, nearly two thousand men are kept busily at work,

cate, certain to fit with absolute exactness, could be forwarded at once.

Natural Gas.

The fact that a large and steady flow of gas had been obtained by boring into the earth at various points on the Lake Erie shore, induced the Buffalo Gas Company to put down a well in that city, in the expectation of reaching gas.

The work was begun on the first of February, and is now completed. The first vein of gas was struck at a depth of 318 feet, and the gas fissures gave out their contents at nearly regular distances of 20 feet thereafter. At the depth of 630 feet the salt water was thrown out of the well with such violence as to show there was a very strong impelling force beneath it. The water was then pumped out and the well was tested, when the gas began to flow freely. The tube, a two-inch one, was

We clip the above from a late number of the New York Gas Light Journal.

MORTON'S DOOR AND GATE SPRINGS.—These springs, though well known and extensively used at the East, have never, until now, been introduced into this State. Mr. Davis, well known in connection with his patent "Refrigerator Fruit Cars," which have so successfully transported California fruits to the East, has purchased the right for the above-named springs for the seven States and Territories on this coast, and is now here for the purpose of introducing them. The object of the invention is to obtain a more reliable and serviceable spring than has hitherto been in use for closing doors and gates. The device is simple, cheap, durable and not unsightly, and may be seen and examined on the doors of the *Alta* office, on California street, where builders, architects and others may call and examine them at their leisure.

MECHANICAL PROGRESS.

THE "WOOLWICH INFANT."—This is the nickname of the 35-ton gun, which has recently been tested. *Nature* for May 18th has a notice of it, from which we condense: "That the gun is not merely a show production, as was the case with the monster Krupp cannon, but a really serviceable and efficient fire-arm, is shown by its endurance of the severe test to which it was subjected at proof. On this occasion the 700 lb. projectile was thrown from the gun by the enormous charge of 130 lbs. of gunpowder—the largest, in fact, that has ever been safely consumed in any fire-arm—the explosion being without the slightest injurious effect upon the steel bore or surrounding wrought-iron castings. The solid cylinder of iron which constituted the shot issued forth at the terrible velocity of 1,370 feet per second, and, after traveling some fifty yards, buried itself in the hntt of loose earth to a depth of thirty-three feet. * * It is calculated that at a distance of fifty yards the heavy projectile would be thundered forth with such force as to penetrate fourteen and a half inches of solid iron; an armor plate such as no vessels of our present construction are enabled to carry. At two thousand yards—upwards of a mile, therefore—the shot would possess enough penetrating force to pass clean through the side of the strongest ironclad afloat. * * The utmost distance to which 'the Woolwich infant,' as it has been nicknamed, will in all probability be capable of projecting a shell is about ten thousand yards, supposing the arm to be laid at an elevation of some thirty-three degrees. So satisfactory, indeed, has this experimental structure turned out, that a further batch of sister guns have forthwith been commenced, and will serve to arm some of our heavy iron-clads which are now building. Only a small number of such weapons will be carried by these vessels—two, or at the most four, apiece—and thus our modern men-of-war will present a perfect contrast to those of a dozen years ago, when a ship, being regarded merely as a box of guns, sometimes received on board as many as a hundred and thirty cannon. Nevertheless, a broadside delivered from four guns of these giant dimensions (for the whole armament being carried in turrets may be brought to bear at one time), representing almost a ton and a half of metal, very far exceeds that which an old first-class three-decker could throw into her antagonist, and would indeed be sufficient to sink most vessels at a first discharge."

TERRA COTTA.—This material, which sixty years ago was in favor, but has been out, is again attracting much attention. The International Exhibition at South Kensington is rich,—says *The Engineer*,—in terra cotta. That journal goes on to describe the manufacture. We condense from the issue of May 12th:—"The substance of the article is clay from Dorsetshire and elsewhere. The blocks or lumps being dried, are hammered into fragments, ground and sifted; the fine powder is then moistened, and becomes plastic, and, after kneading, perfectly homogenous. It is then pressed by hand into plaster moulds, and afterwards hand finished with all the care bestowed by the artist upon a block of marble. The 'touching-up' process having been completed, the cast is allowed to stand in a room until a considerable portion of the remaining moisture has evaporated. A lighter tint then shows itself, and the clay becomes sufficiently hard to be handled without receiving any impression or distortion. It is very important that this drying of the clay should take place equally in all parts. A draught of air setting in one direction may produce an unequal drying, and the effect will be seen in a cracked and distorted figure when the object is taken out of the kiln. When duly hardened by the atmosphere, the terra cotta casts are put into the kiln and baked, or 'fired.' If this operation be effectually performed, the clay becomes slightly vitrified and extremely hard, so much so that a pointed steel instrument, such as a knife, produces no effect if drawn across the surface, but sends forth brilliant sparks. This is the test of true terra cotta. Arches, pillars, friezes, chimney shafts, and other architectural devices and decorations, are produced in terra cotta, at a price from

half to one-third that of Portland stone. In some instances it is glazed, as in the case of garden seats, thereby producing a smooth and glassy surface. In reference to the decorative use of terra cotta, it is observable that the more elaborate the decoration is made the greater is the cheapness as compared with stone. The manufacture is largely on the increase, and there can be no doubt that the present Exhibition will give additional impetus to this ornamental industry."

A NEW LATHE.—The *Cabinet Maker* for May 20th has a description of a recent English invention, from which we extract:—"It is for turning articles in wood of any desired shape, and any length, without 'chucking' the pieces. The machine is of a lathe-like form provided with a hollow mandrel, through which the blank is caused to pass by feeding mechanism which consists of a pair of rollers, one of which is plain and the other toothed or serrated. The rollers are adjustable by springs, so that blanks of any size within the diameter of the hollow mandrel can be placed between them. The blank as it leaves the feed rollers is acted upon by rotating cutters, which reduce the wood or metal to a circular form to prepare it for the shaping cutters. The blank then enters the hollow mandrel and passes through it, when the shaping cutters are caused to act and produce hollows and projections upon it according to the shape of the pattern plate, which is upon a wheel on the side of the machine. The wheel is fitted in a slot in the frame, so that it can be removed and others placed in its stead according to the length of the article to be produced. The cutters are preferably of V shape and revolve at a high speed; they are caused to act upon the blank by means of a pin which works against the pattern plate. The cutters are adjustable and follow the undulations of the pattern by means of springs. The article as it leaves the shaping cutters is received by an automatic holder, which is also a polisher or finisher, so that the article before it finally leaves the machine is in a finished state. The hollow mandrel can be reduced in size by inserting short tubes into it, and the knives adjusted accordingly. There is scarcely any limit to the variety of articles which can be produced by this lathe; among them may be mentioned wheel spokes and naves, chair legs, table legs and rails, banister columns, pen holders, billiard cues, crochet needles, broom handles, furniture knobs and rails, piano action rods and walking sticks, knife and tool handles, vent pegs and railway trenails, curtain rods and headstead poles. All that has to be done is to set the machine in motion and enter the stuff between the feed rollers, keeping up piece after piece as the work is completed for any period of time."

NEW SOUNDING APPARATUS.—At a late meeting of the New York Association for the Advancement of Science and Art, G. Livingston Morse described a device of his own, which consisted in arranging several glass spheres, one above the other, within a casing of hemp or leather, the case tapered at both extremities, and containing at its lower portion a small flexible mercurial reservoir, so constructed that, on receiving pressure, the mercury will be forced from the reservoir into another vessel. When the instrument descends in the water, the quantity of mercury forced by the pressure from the reservoir into the receiving vessel determines the precise pressure, and indicates the exact depth of the water. A freezing mixture is intended to surround the mercury, and keep it at an even temperature. A weight is fastened to the instrument, which weight is detached when it strikes bottom, and then the instrument immediately rises to the surface. No time is used.

PINS.—The annual product of pins in the United States is 2,000,000 packs, each pack containing 3,300 pins, or a total of 6,600,000,000. This is the yield of eight factories. One manufacturers' agent in Boston, according to the *Commercial Bulletin*, sells every six months 1,000 cases, each containing 672,000 pins. The factory represented turns out eight tons of pins per week. Hair pins are jobbed by the case, and but one factory makes them, but that at the rate of fifty tons per month. The machine which cuts and bends the wire, makes 360 hair pins a minute, ready for japanning. The production and consumption of pins increases ten per cent. annually.

SCIENTIFIC PROGRESS.

A NEW CONNECTION FOR THE INDUCTION COIL.—Prof. E. J. Houston describes in the *Journal of the Franklin Institute* for June, some experiments made with a view of increasing the quantity of the spark of the induction coil without greatly diminishing its length. By connecting one of the poles with the earth, and the other with a large insulated conductor, a thick quantity spark five inches in length was obtained with an instrument which throws a six-inch spark in free air. We quote: "One of the poles or ends of the secondary wire was connected with the earth by a copper wire attached to a gas pipe. The other pole was connected with a wire, which rested on a large lecture table holding the coil. On turning the break piece, the electricity, instead of being lost by passing along the wires to the earth, jumped from the pole connected with the table, to that connected with the earth. The thickness of the spark was greatly increased, its length diminished, and its color changed to a silvery white, as when a Leyden jar is placed in the path of the discharge. While the electricity is flowing between the points, long sparks may be drawn from any part of the table, or from any metallic article within eight or ten feet of the coil. * * A large insulated conductor was extemporized by placing some old tin stills and percolators on large glass jars. On connecting one of the poles with the gas pipe, the quantity of the spark was increased. The conductor was then divided into two, of about equal size, which were connected with the poles. The quantity of the spark was increased, with, however, great diminution in the length. By successively diminishing the size of one of the conductors, and increasing that of the other, the length of the spark was increased, without any sensible diminution in its quantity, until, when one of the conductors was less than one square foot in surface, a fine quantity spark of about five inches was obtained. * * In all the experiments in which one pole was in partial connection with the earth, as when it rested on the table, the loss of electricity must have been very great, for several gas and water pipes are in connection with the table. If, then, the table merely serves as an imperfectly insulated conductor, which allows the rapid induction of electricity in the secondary wire by its rapid discharge, and thereby, notwithstanding the loss, gives so great an increase in the quantity of the spark, it would seem, that if, instead of the table, an insulated conductor of very large surface were used, a much greater increase in quantity would be obtained."

LIGHT THROUGH COLORED GLASS UPON VEGETATION.—At the last monthly meeting of the Pennsylvania Society for promoting Agriculture, General Pleasanton read an essay upon the chemical effect of the sun's rays upon vegetable life when transmitted through different colored glass. The following experiment with a grapeviny was noticed. The grapeviny was 84 feet by 26, and 16 feet high at the ridge. Into the glazing, at every seventh row of panes of white glass, a row of violet glass was introduced, alternating on opposite sides of the roof, so that a violet beam should fall eventually on every leaf in the grapeviny. The cuttings planted grew rapidly and new wood was noticed daily. In a few weeks the walls and inside of the roof were closely covered with luxuriant foliage. Experts pronounced the vines thus treated far superior to those grown in the usual way. Cuttings planted in 1861, in 1862 produced a wonderful crop of grapes. In 1863, the amount of fruit was equally large, and has continued thus, season after season without abatement, the vines seeming to require no time to rest.—*Iron Age*, May 18.

OZOKERITE.—In our issue for June 3d we gave an item from London *Engineering*, in which this substance,—there called "ozokerit,"—is spoken of as a vegetable wax. Prof. Wurtz, in a late number of the *Gas-Light Journal*, says of it: "Ozokerite is nothing more, or less, or other, than mineral paraffine, which is an abundant natural product concomitant with our Pennsylvania 'petroleums.' It was first discovered as a mineral species in 1833, in Moldavia, by Von Meyer, and is known throughout the German countries quite familiarly as 'Erdwachs' (earthwax.) Its composition approaches carbon 85 hydrogen 15, which appears to indicate (if it belongs to the saturated hydrocarbons, as the most eminent of living chemists, Berthelot, appears to have proven, or what he calls

the "formene" or marsh gas series, of the generic or molecular formula C_nH_{2n+2}) somewhere about the composition $C^{84}H^{16}$, which corresponds exactly to this. I must be remarked that Berthelot's examination of American paraffines by his method of synthesis by hydrogenation, gave him a molecule much more highly condensed than this, namely $C^{80}H^{12}$, calling for the centesimal composition carbon 85.04, hydrogen 14.96. An analysis of Galician ozocerite, by Hofstaedter, is cited by Dana, in his last edition (p. 732) which gave carbon 84.34 hydrogen 14.87. All paraffines, however, both natural and artificial, are evidently mixtures of compounds of typical composition, which may vary within small centesimal limits."

ACTION OF HEAT ON PROTOPLASMIC LIFE. At the meeting of the Royal Society in London May 4th, F. Grace Calvert, F. R. S. read a paper upon this subject which gave rise to a discussion, some of the experiments detailed seeming to prove that life might remain even after a temperature of 300° F. for half an hour. Dr. C. Bastian considered the experiments wholly inconclusive. "With regard to the influence of heat upon the life of Bacteria and many other organisms, Dr. Bastian gave some particulars concerning experiments, which tended to show, as he thought, conclusively, that they were all killed by an exposure in fluids, for ten minutes, to a heat of 60° C. (140° F.) There was no difficulty in ascertaining when Amoebæ or Ciliated Infusoria were killed, though with respect to Bacteria there was much more difficulty. Where the movements were not of an active character, after the Bacteria had been subjected to different degrees of heat, no reliable opinion as to their life or death could be arrived at. Bacteria which were really living might in many cases exhibit movements different in no respect from those which dead Bacteria would display. From the exhibition of such movements, therefore, it could not be positively affirmed that the organisms were living, or that they were dead. The case was different, however, with regard to reproduction—dead organisms could not multiply. Having found a fluid, therefore, which was most suitable for the nourishment of Bacteria, but which seemed wholly incapable of giving origin to them *de novo*, he inoculated portions of it with living Bacteria, and then found that those fluids which had been heated to 50° C. or 55° C. for ten minutes became quite turbid in two or three days, whilst others, heated for the same time to 60°, 65°, 70°, 75° C. and upwards invariably remained clear and showed no signs of turbidity. As living Bacteria will always multiply under suitable conditions in suitable fluids, their failure to multiply was the best evidence that they had been killed."

PHOSPHATE PROCESS FOR UTILIZATION OF SEWAGE.—David Forbes, F. R. S., has a second paper upon this subject. Our readers will remember a notice in the Press of his paper read last year before the British Association. He now gives results of the working of the process upon a large scale. We quote from the *American Chemist* for May: "To the disposal of the sewage by distributing it at once over the land, there are several objections. The suspended and most offensive solid matters in the sewage cannot sink into the soil, but remain upon the surface, covering the plants with fetid matter and polluting the atmosphere; moreover, sewage, although rich in ammoniacal salts, is very poor in phosphates, and therefore its application in general farming is restricted. By the application of the phosphate process these difficulties are overcome. This consists in treating the sewage with a solution of the native phosphate of alumina dissolved in sulphuric or hydrochloric acid, which arrests decomposition and causes the precipitation of the suspended matter. The liquid thus purified will now carry to the land a considerable quantity of soluble phosphates in addition to its other ingredients. The process as in operation at the Tottenham Sewage Works, goes a step further by precipitating all the fertilizing materials. The sewage is run into reservoirs along with a suitable quantity of the phosphate solution, and immediately afterwards milk of lime is run in sufficient to neutralize the acid of the solution. This precipitates the phosphates in solution together with all the organic matter, and, after settling, the supernatant water can be discharged into the streams, without polluting them. The purification requires from three to eight hours. * * The writer, however, does not think the manure will pay the cost of the process, though it will nearly do so, and is considerably more advantageous and economical than the other processes proposed."

CORRESPONDENCE.

Wastage of the Precious Metals.—No. 3.

[Written for the Press by ALMANN B. PAUL.]

The closer we investigate the question of loss of the precious metals, the more astounding are the facts disclosed, the millions upon millions that have been allowed to escape from our hands can only be estimated by the amount produced. That all the fault of loss may not be laid on gold miners, I will now present some facts connected with silver mining, taking a few of the prominent, and most efficient cases of working on the Comstock lode, as evidence of what the loss is in the best class of mills, working on the best ore. By this means the reader can form some idea of what the loss is likely to be in this poorer class of mills and on ores less easy to manipulate. From the statistical tables now before me of the Hale and Norcross Co., I find that in one year 28,000 tons were worked, producing \$1,135,220, with a loss of \$762,516, being about 36 per cent. The product of 14 mills, all working for several months on Comstock ore, was \$816,977, while the assay value was \$1,288,132.

It will thus be seen by the most unquestionable statistics that the best of the Comstock mills do not average over 65 per cent., though some claim, but have not kept statistics to prove it, that they have worked up to 75 per cent. The Comstock has produced (without entering minutely into a calculation), about \$140,000,000, making a loss of over fifty millions of dollars in less than twelve years. As corroborative evidence of the loss by mill working in general, is the fact that the working over of tailings has grown into quite a business, the product of which in a measure lessens the percentage of loss for amount worked, but the quantity retained is small in proportion to the amount of ore reduced; so that a deduction of 5 per cent. on gross loss will probably give full credit for that which is produced by re-working.

It is a very singular fact that in no portion of the State of Nevada, are the ores as pure as those of the Comstock lode, and as all are worked upon the same plan as the Comstock, their percentage of value is much less—excepting in cases where furnaces are used and no expense spared to purify the metal. I am speaking only of mill ores. The reason of this low percentage, is that lead, copper or antimony, in all their various combinations as sulphurets, carbonates and chlorides, is more or less intermixed with the ores, vitiating the mercury, and thus rendering amalgamation difficult. In gaining percentage in silver working, the question of expense is more to be considered than gold. The ores of Nevada, in fact I may say silver ores everywhere occur in such a multiplicity of combinations that it requires more skill, science and experience to manipulate them, than gold, and yet the percentage on the whole, is above that of gold working in California, showing, as I assert, that our system of silver mining is ahead of our gold mining. In silver districts, about every locality has its own peculiar combination of base and precious metals, which combination exacts respectful consideration, or great loss is the result. To be just, we must admit, that while some mills working on very troublesome ore do not produce over 35 per cent., there are a few mills, as before remarked, working regardless of expense on rich ores, which do produce on the average as large as 85 per cent.

There is one marked difference, too, in our gold and silver mining, and that is, a clearer knowledge of what the loss is—if only 30 per cent. is obtained, they know it and seek to better it. The system of sampling ores, and the careful assaying of the same, is carried on now in nearly all the Comstock mills to a commendable degree of exactness, which is not only highly important in a statistical point of view to those interested directly, in a pecuniary way, but is of general value. This is worthy of imitation in California, but, at the same time, no such correctness can be expected in gold, as in silver; for the reason, that silver is more universally disseminated in the ores, while gold is less so, and as one portion may have a small particle more than another, its greater value when multiplied into tons, often renders erroneous values. It is only by great care

with a number of assays, that correct values can be obtained in general working. Tests, such as given in my last, are more to be relied on. The silver mills of Nevada surpass the best gold mills of California in order, system, neatness, expansiveness and of course expense—but that expense pays. There are mills there costing over one million of dollars and but few less than \$25,000, while the average will reach as high as \$80,000 possibly \$100,000.

If a California gold miner, who has not had experience out of his own State, should visit the best works of Nevada, he might be much benefitted by what he saw, and possibly become less conceited of the perfectness and vastness of California mining. At all events he would be satisfied that there was something yet to do at home. There is one thing in favor of Nevada, that for silver mining she has had full command of capital, while gold mining has had to hold its own the best it could; but let more interest be manifested in gold and it will in every way come fully up to the standard. With this I will close, although I could write more on the same subject, with a multitude of facts, setting forth the loss daily taking place—wealth which we all would like to handle, and are much in need of in the present condition of business. It is to be hoped at least, that the facts concerning these losses will be more closely investigated, all of which will rebound not only to individual, but to the general good.

The Sanitary Effects of Coal Oil Questioned.

EDITOR'S PRESS:—Your correspondent was much astonished by a statement which has been going the rounds of the papers of late, purporting to emanate from a distinguished physician of Santa Barbara, ascribing the immunity which that country enjoys from the ravages of such diseases as scarlet fever, small-pox, diphtheria, chills, and the like, to the presence of such large quantities of petroleum in that portion of the State. On perceiving in your last issue that this hypothesis had received the sanction of so eminent an authority as your Santa Barbara correspondent, it becomes necessary to examine the subject more carefully and the result is the unqualified adherence to the new doctrine by your present correspondent.

The Santa Barbara savans evidently explain the action of the "peculiar ambrosial influence pervading the air," by the aid of the germ theory of disease, and the "well known action of carbolic acid in destroying low forms of animal and vegetable life," and as petroleum is supposed to contain in its complex arrangements of atoms those necessary to the formation of carbolic acid, it does not require a very strong effort of the scientific imagination to convert the potential into the actual.

These curious speculations led your present correspondent to search for some equally startling hypothesis whereby to account for the remarkable fact, that, while San Luis Obispo county enjoys the same immunity as Santa Barbara county from these epidemic diseases, we have here no coal oil cave in our lamps and oil cans, so our atmosphere lacks the "ambrosial sweetness" of Santa Barbara. After an immense expenditure of brain force, we have been enabled to give birth to a hypothesis, which we think will explain all the facts, without dimming the lustre of the oleagenous theory of our sister county. We start with the same major premise, viz., that these epidemic diseases are propagated by the presence in the atmosphere of the germs of certain low forms of animal or vegetable life, which in Santa Barbara have been eliminated or destroyed by the happy ambrosial influence of coal oil.

Now Prof. Tyndall in his lecture on Haze and Dust, mentions the remarkable discovery made by Schroeder in his experiments on spontaneous generation, that this microscopic filth can be completely removed from the air by simply passing it through a thin stratum of cotton wool; the wool acting as a filter; indeed he recommends that the respiratory made of cotton wool be worn by persons who are obliged to enter a contaminated atmosphere.

We suppose that in the discussion of such an important subject as this, the change of an adjective will make no material difference, and indeed when we venture to substitute "sheep" for "cotton" as the qualifying word to "wool," we only follow

the example of our worthy brothers of Santa Barbara, who make "petroleum" equivalent to "carbolic acid."

A third argument is derived from the well-known fact, that San Luis Obispo county is pre-eminently distinguished from all other counties in the State by the universal presence of sheep. The hills and valleys in every portion of the county, from morn to dewy eve are white with innumerable bands and flocks of Merino sheep. The conclusion therefore is self-evident, that the salubrity of our climate can only be accounted for by the fact that the winds which blow down to us from the northern portions of the State, laden with the germs of scarlet fever, small-pox, diphtheria and every other hideous disease which is endemic in those unfortunate regions, having to pass over and through the fleeces of so many thousand sheep are completely filtered of those organic impurities, and that the wretched germs, by a peculiar process of pangenesis, are transformed into that pest of all sheopmen, the scab, and as such require the "carbolic acid dip" for their destruction.

Were it not malicious we would suggest to the Santa Barbara savans that probably the thick stratum of wool between here and Santa Barbara might be as effectual a disinfectant as the coal oil—that there may be no germs in the atmosphere—that, indeed, the immunity which we both enjoy may be explained more simply than by either hypothesis, i. e., both are sparsely settled counties and in comparatively little communication with the outside world, and these epidemics have never prevailed for the same reason that the climate is not good for bed bugs or cockroaches, which is—that they have never been brought here.

As for us, we live in the belief (shall we say the hope?) that as the county settles up and communication with the outside world is more frequent, we shall be as severely afflicted as other civilized countries, and the time will come when the physician of these southern portions of the country, instead of having to eke out a miserable existence in patching up the effect of night's debauch and assisting into the world a yearly crop of children, will be able to see in this daily practice the same types of disease which they now read in their medical journals with envious eyes!

MEDICO.
San Luis Obispo, June 5, 1871.

The Great Valley of Los Angeles.

EDITOR PRESS:—The great valley of Los Angeles county extends from the sea coast north of the isolated hill of Point Pedro, in a southeasterly direction, parallel to the sea coast, a distance of some forty miles in length, by ten to fifteen in width; embracing all the space between the foothills and the sea. This plain is crossed by the San Gabriel and New rivers, which are in fact, the same stream, running in two channels, the intervening strip of land being called "Los Nietos," or the wet lands; the same terms including also the lands lying contiguous on the east and west sides of said rivers.

This tract extends from the sea to the "Moute," which is simply a continuation, and has heretofore been known as the famous corn region. Next east of the San Gabriel, is the "Coyote," a smaller stream; and lastly we have the "Santana," which rises in the lofty mountains east of San Bernardino, and flows on through the San Bernardino valley, and the low hills, separating that from the Los Angeles valley, passes the town of Anaheim, on its way to the sea, and furnishes an ample supply of water for irrigating the lands contiguous to it, for a distance of some sixty miles.

This great plain or valley seems to have been originally an extensive salt marsh, resembling those around the Bay of San Francisco, and has been reclaimed and made valuable by the constant and long continued deposition of sand, gravel and soil brought down by the rivers, streams and gulches from the adjacent hills and more distant mountains, so that it must be from the manner of its formation, entirely alluvial.

The soil, which is many feet in depth, is composed of a mixture of fine sand, clay and vegetable mold, and is the "cream" from the surface of the back country which has been "skimmed off" by the action of the rains, and deposited in this favored valley, for the benefit of those who have foresight enough to settle upon and possess it.

Its productive powers are wonderful.

Its capacity for absorbing and retaining moisture is remarkable, and when once thoroughly broken up and pulverized, it is as mellow and friable as an old and well cultivated garden, and can be plowed and planted at all seasons of the year.

A large proportion of the water flowing in the rivers, sinks during their passage through the low lands, and permeating through the porous soil, maintains its level throughout the whole extent of the valley, and is found at a depth of from one to twenty feet from the surface, (averaging about six feet), the depth depending entirely upon the undulations of the surface. The supply is practically inexhaustible, and has not been affected by the drouths of the past two years.

The lands in which sand predominates, and which are not covered with a crust of "hard pan," are always moist to within an inch or two of the surface. Those in which the clay is in excess, (which are much the best) are generally covered with a crust (hard pan) of from six to fifteen inches in thickness, which, when dry, is exceedingly hard to break and pulverize with an ordinary agricultural implement; but which, when wet, swells and becomes friable. If, in this condition, it is well pulverized, and not permitted again to become sodden with excessive moisture, it will remain permanently loose and mellow, receiving from below an ample supply of moisture by the process of capillary attraction, and will never again be dry.

This valley, when properly cultivated, will be independent of rain; and the cultivator, in years of drouth, will always be able to raise fair crops.

As this letter is already spun out to a considerable length, I will close with this remark, that, if you desire, I will, on some future occasion, give you my views and experience in regard to this and kindred topics.

WM. R. OLDEN.

Anaheim, May 31, 1871.

We should be pleased to hear again, and often from our correspondent.

Banner District, San Diego County.

EDS. PRESS:—Since my last communication, April 2d, mining has very much improved, and matters in general look better.

The Golden Chariot Mine.

This Company has had 12 tons of rock crushed at McMeah's mill, averaging \$182 per ton. The shaft on this mine is down 50 feet, and they are still sinking—rock improving.

The Baily Mine.

A level is being driven on this mine on the vein, which will give an immense amount of quartz, when stopped. This rock is rich in silver and is worked in an arrastra, at present, for gold only. The vein is fully 3½ feet wide.

Redman Mine.

Quartz is being crushed at present from this mine, which it is supposed will pay \$200 per ton. The vein at present is about two feet wide on an average.

Kentuck.

This company has had about 30 tons of rock crushed, averaging \$76 per ton. The shaft is down 37 feet, and they are now drifting the width of the vein, from 2 to 8 feet. This is considered one of the best mines in the district. The quartz is stratified and full of sulphurets; and indications of silver are present.

Madden Mine.

This company is now sinking a shaft. They are down about 28 feet from the surface and have two veins in the shaft—one about 16 inches wide, other from 10 to 12 inches. The upper or south vein is the richest. This company has had 15½ tons crushed, averaging \$41 per ton. The walls of this vein are very hard.

Antelope Mine.

A shaft is being sunk on this vein, and a level run. The vein varies very much in size from 6 inches to 10 feet. The country rock is very much disturbed and dislocated. This has been the best paying mine in the district, so far. The company have erected a new 5-stamp mill which has been running successfully for the last ten days. From 15 tons of rock crushed, they cleaned up 13 lbs. of amalgam.

Chaparral Mine.

This company is still sinking with fair prospects of success. We intend to have the Banner district well represented in the coming Mechanics' Institute Fair. We expect to win in the way of specimens. We have had a large number of distinguished visitors here lately; the SCIENTIFIC PRESS is a great favorite in this camp, and before long its circulation will be largely augmented.

S. D. McLENNON.

May 23th, 1871.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

EXCHEQUER.—*Chronicle*, June 3d: Work on this mine is progressing satisfactorily. A few days since a vein of gold quartz was struck in the east drift of the main tunnel, 200 feet north of the winze. The vein is eight inches wide, and two lots assayed 2,547 and 2,057, respectively, in gold and silver per ton. Manager Chalmers is cross-cutting the ledge to get to the hanging wall; has run 27 feet and is not through it—thus far it is 33 feet wide, 6 feet of it being in the tunnel.

GOT IT.—*Miner*, 3d: This morning the best strike of the season for the Globe was made in the main tunnel. We saw a chunk of near 20 pounds weight which was pronounced by judges worth \$50 per ton. The vein is said to be five feet wide next the east wall.

A new strike was made this week in the down shaft of Monitor No. 3. Ore of fine quality and apparently a good body of it is coming in on a pitch from the west. Good ore still found, in both drifts on the main level.

The raising of the last timbers of the Monitor mill last Saturday was well attended, and the timbers went together like clockwork.

AMADOR COUNTY.

THE KENNEDY MINE.—*Dispatch*, June 10th: The owners had a clean-up Sunday, after a 20 days' run, which yielded \$7,000. We understand that the lead is widening out as they go down, and the prospects are daily becoming more flattering.

THE STRIKE.—The same journal says "the conduct of the league in compelling men to quit work who did not belong to the association—is justly condemned by citizens of the county generally. We are inclined to believe, however, that the strike is about ended; and that the mills that have been stopped in consequence of it will resume operations as soon as they can get men to work, which may take them a week or two; as we understand the owners have resolved not to employ any of the members of the league again."

CALAVERAS COUNTY.

THE BIG MINE.—*Chronicle*, June 10th: In this mine at Railroad Flat, recently purchased of Lewis Brothers by a San Francisco company, work is vigorously pushed, 14 men being employed. The lead is developing finely. A portion of the rock has been hauled to Harris' mill and crushed, netting \$3,000. We hear it rumored that the company will lease the Lewis mill.

A HEALTHY CHUNK.—The Zambrana mine at Mosquito Gulch, continues to yield enormously. The last crushing—50 tons—produced 459 ounces of retorted gold, worth \$8,032, an average yield of \$160.50 per ton. The rock has been paying at nearly the same rate for some time.

PALOMO.—The average yield of the Palomo mine in Lower Rich Gulch, for some time past has been \$4,000 per week. Last week \$5,000 were cleaned up. The main shaft is to be put down 200 feet deeper, and the sinking has already commenced. When completed the total depth will be 600 feet. It is also contemplated to erect an additional battery of 40 stamps, making 76 in all.

GOLD.—Lewis Brothers & Co., near Railroad Flat, cleaned up recently, the proceeds of the run approximating \$3,000. We learn that work has been partially suspended. It has become necessary to sink the shaft deeper.

THE SITUATION.—We are informed that the product of the mines in this section of the county, so far this season, fully trebles that of last year. Over \$20,000—quartz gold alone—were shipped from Mokelumne Hill the present week, and no returns were received outside of Lower Rich Gulch, Railroad Flat and Mosquito Gulch. Placer mining is also improving. It is true that the easily worked surface is nearly exhausted; but hydraulic and tunnel mining are being prosecuted with increased vigor.

EL DORADO COUNTY.

GEORGETOWN.—Cor. of Placerville *Democrat*, June 10th: The mining interests of this divide continue to improve. New and richer developments are made every day. The St. Lawrence carries free gold all through, and is five feet wide. The company are sinking their shaft by contract, having let it last week, for 50 feet. I have been informed that they have been offered

\$100,000, but that they ask \$200,000. The great advance in price from this \$15,000 paid is owing to the thorough prospecting that has been done. The Eureka continues to take out ore. The Taylor Co. are pushing things lively, and taking out rock that will run up to \$30 per ton. They will start the mill next week and run through 100 tons before erecting any more stamps. The Sliger claim was handed to-day by Peachy, Cronise and Cochrane, of San Francisco, for \$25,000—four months time.

INYO COUNTY.

BULLION.—*Independent*, June 3d: During the week ending Saturday, May 27th, there were shipped from the works of the Owens' Lake Silver Lead Co. at Swansea, 581 bars of bullion, weighing 51,792 pounds.

KERN COUNTY.

KERNVILLE.—Cor. of the *Courier*, June 3d: The Big Blue mill, 16 stamps, and the Wadleigh mill, of 10 stamps, both belong to the Blue Lead Co., and are in charge of Mr. Sanhorn, who has a lease of them, together with all the mines belonging to the company. Big Blue has been worked by open cut to a depth of 30 or 40 feet and 70 feet in width across the vein, and a drift has been run about 36 feet further in the direction of the hanging wall, but no wall has been found. Assays made some time since of rock taken from every six inches across the vein for 60 feet, averaged \$17.50 per ton. Bull Run has been abandoned for the present, except that two small companies are taking out rock on shares near the eastern extremity, above water. This ledge, two feet in width, is quite rich, averaging \$20 per ton. The Jeff Davis is being worked on shares. The ledge is not extensive, but extremely rich, frequently turning out \$75 to \$100 per ton. The Beauregard has paid richly near the surface, but is not worked at present. Summer ledge, principally owned by A. Staples & Sons, is the northeasterly half of the Big Blue. A shaft has been sunk 80 feet from the bottom of which they have recently taken rock which turned out \$70 per ton at the mill.

NEVADA COUNTY.

ALTA No. 3.—*Grass Valley Union*, June 8th: Good dirt is coming out of the shaft from the north drift, and the bedrock is pitching. It is supposed a new channel has been struck. On Tuesday night an attempt was made to burn the building over the hoisting works, but the blaze was seen in season and extinguished.

PROSPECTING.—The Manhattan tunnel has reached a depth of 200 feet and is still sinking, producing good quartz; and the Branch Mint tunnel is in one-eighth of a mile, and will lap the ledge in a few weeks at an enormous depth. Both claims are expected to make good mines at once.

SOOGS.—*Gazette*, June 7th: The old Soogs mine, known also as the Nevada City mine, has been leased to parties in Virginia City who will commence work in 20 days.

THE RICH STRIKE.—The *Transcript* of 7th says that the \$800 in dust taken out by the two men in four days on the Washington road is of such mixed character, being partly coarse river dust, as to render it probable that it is the dust lost by the stage owner as before suggested.

SELBY FLAT.—A correspondent writes: "With capital a company might run a tunnel with a 16 inch grade from Selby Flat under Thomas' Flat and Myer's ravine, until the grade comes out. The distance would be about a mile and the line direct. Shafts required to work the tunnel in sections would not be more than 30 feet deep. By a similar tunnel, the writer thinks the ground could be worked in the Kansas, Empire, and the claims on Cement Hill. The writer says the ground is known to be rich and extensive enough to last a hundred years, and that a company opening such tunnels would be well paid, though it did not own a foot of ground."

Same of 8th says: The Mount Auburn and Radical quartz claims, out near Cleveland's ranch, have been purchased by San Francisco parties, and work will soon be commenced on them.

PLACER COUNTY.

LAST CHANCE.—*Stars and Stripes*, June 1st: The Yule claim, two miles from Last Chance, at Startown, is the best claim in that section. The scene of present operations is 1,300 feet from the mouth of the tunnel, where a "breast" measuring 130 feet parallel with the tunnel, is being driven toward the West line of the Yule, which is the East line of the Morning Star. Thirteen men besides the Superintendent are employed. Along the line between the two claims, and for 300 feet further into the hill, the Morning Star Co., have realized returns equal to those obtained in the

Yule claim. We saw the clean up on Friday which was limited to the three upper sluices and resulted in a yield of twelve ounces five penny weights of coarse gold salable for \$18 12½ per oz. at Michigan Bluff. Including the above, the yield for five days of last week amounted to 64 ounces, netting over and above all expenses more than nine hundred dollars. Considering the uniform results obtained, we may calculate on seven hundred ounces as the yield from the block of ground—ninety by one hundred and thirty feet—between the present line of operations and the West line of the claim.

GOLD RUN.—Cor. of same: Judd & Co., a few days ago cleaned up \$6,000 from 18 days' run. This claim is managed by Judd in person. His sluices are four feet in width. He runs 500 inches of water and throws it against a bank of 150 feet high through Hoskins, "Dictator." The cement mill of the Indiana Hill blue gravel drifting Co., will in a few days close down for repairs. They will remodel their batteries and put in a new set of mortars. This claim has paid well.

Same of 8th says of the last Last Chance mines: Anderson & Co., are getting pay very little below the figures of the Yule and Morning Star. Hyland & Co., are opening up the old El Dorado ground. Taylor & Co., are in daily expectation of tapping the "front channel" with their tunnel. Never has there been a more prosperous season or better feeling in the district.

And of Gold Run: Last week Squire Brown cleared up \$5,200 in the Golden Gate claims, after twenty-three days' run. On Friday Judd & Co. made another clean up, having run twenty-one nights and twenty days, and realized ninety-nine pounds of amalgam, valued at \$7,400 gross, a profit of more than \$5,000.

The Summit Co., at Dutch Flat, cleaned up \$4,300 after a run of 17½ days.

THE WESKE CLAIM.—*Herald*, June 10th: This is two miles above Michigan Bluff. It is a gravel claim, and contains 210 acres the property of Adolph Weske. On last Saturday a clean-up of six days' work of 20 men was 261 ounces worth \$17.50 per oz., or \$4,582.50. This shows over \$38 per day to the man, and if we deduct \$360 wages for the men at \$3 per day, Mr. Weske has cleared in one week \$4,222.50.

The same gives an extract from a private letter from Mich. Bluff, June 8th: All the talk here is about big pay in the Weske claim Turkey Hill. They cleaned up last week 264 ounces, and picked up 60 ounces yesterday before dinner. I saw several specimens of the dirt. It is a sort of blue cement and is the richest ever discovered here. The tunnel is in 1800 feet; the paying gravel is about 2½ feet thick.

DILLON MINE.—Dillon, Hines and Cowan have completed their water power pumps, hoisting works, etc., and everything works to a charm. This mine shows a monster ledge and has yielded by ordinary mill process \$80 to the ton, working all the rock good and bad.

COX & DENTON MINE.—The is, it is rumored, conditionally sold for \$20,000, \$5,000 of which is a forfeit if the other \$15,000 is not paid in 60 days.

PLUMAS COUNTY.

ARGENTINE.—*Quincy National*, May 27th: On Wednesday the old Hesler Quartz Mill, was totally destroyed by fire, supposed to have been the work of an incendiary.

BIG LEDGE.—A very important strike was made at Argentine, last week, by the discovery, in Ray & Concklin's tunnel, of a well-defined vein, twenty-two feet wide, which prospects better than any rock heretofore found in that locality.

INDIAN VALLEY.—Cor. of same: The miners of North Arm are doing unusually well. John Davis & Co. have taken out good pay; first clean-up, 10 days' run, two hands, \$450. Pierce & Pulsifer, first clean-up, two weeks' ground-sluicing, \$500; second clean-up, 14 days' pining, \$1,200. Whitlock & Lewis are doing well. Tanner & Co. have struck very rich ground. Morton & Green are working with their usual good prospect. There have been extensive diggings struck lately, which will not be worked until another season, for lack of water. Light's Cañon never prospected better in its palmy days. In Cook's Cañon, Huntington has averaged ten dollars per day for the season, with a light head of water.

BIG PAY.—Same of June 3d: Bidwell & Co., of Greenville, are crushing rock, which averages, we are told, \$20 per ton. It is from the Union mine.

SIERRA COUNTY.

ITEMS.—*Messenger*, June 3d: C. W. Hendel, U. S. Deputy Surveyor, is surveying for the Sierra Buttes Co., their quartz

mine, preparatory for a patent... It is rumored that this old quartz mill, known as Wheeler's, will be put in operation again.

SISKIYOU COUNTY.

This Yreka Union for May 31st says: The claims on McAdam's Creek have been filled up with water for a long time.

TRINITY COUNTY.

DUTTON CREEK.—*Journal*, June 3: Dixon, Hurst & Co. this winter demonstrated the fact that they had very rich ground. They also learned that the pay gravel was too hard to pipe. The only way of working their claim seems to be by blasting. This they propose to do on a large scale, by tunnels to be stored with powder by the hundred kegs, which will be fired by means of electricity.

BETTER.—Gold dust is coming in more freely and the yield so far is much better this season than last. In Weaver Basin there was a third more work done last winter than in the one before.

Nevada.

ELY DISTRICT.

BULLION.—*Record*, June 4: Wells, Fargo & Co. shipped, on June 1st and 3d, by the way of Salt Lake, bullion amounting to \$31,247.89.

On June 4th and 6th, \$27,364.61. Also, on the 8th, \$15,279.77. Total, \$42,664.38.

EUREKA DISTRICT.

PHENIX CO.—*Sentinel*, June 7th: This Co. has purchased the Silver West furnace, and the fire will be set this evening. By the 10th inst., they will commence making bullion at the rate of five tons per day. They will run on their own ore, and three and a half tons of ore that will cost to raise not to exceed \$7 will make a ton of bullion which will assay not less than \$350.

TWENTY FOUR HOURS.—Same of 8th: Eureka Consolidated Co's., Works, in two large and two small furnaces, smelted 101½ tons of ore yielding one-sixth bullion. The bullion is worth \$350 per ton. We believe that to be a large amount and of greater value, than has been made in the same number of furnaces in America in 24 hours.

MARYLAND MINE.—The English representative of the Pinto S. M. Co., was at the mine, on Tuesday, and is satisfied with the purchase. The Supt. has taken possession, and will at once proceed with the work.

NINETEEN TONS.—Same of 11th: For 24 hours, up to Saturday noon, there were smelted in two large and two small furnaces of the Eureka Consolidated, 19 tons of bullion, of the value of \$350 per ton.

NEW STRIKE IN AN OLD MINE.—We stated that the Richmond were near the point at which they expected to find a new body of ore. Two days since they found a larger body of ore than has been reached at any previous time.

HUMBOLDT.

BATTLE MOUNTAIN.—*Silver State*, June 10th: The Butts Co. is driving ahead with its mill, working 50 men on mill and mine. Knowles & Co., are erecting hoisting works on the White mine. Captain Richards, of the English Co's. copper claim, is pushing work with energy. Robert McBeth is driving away on the Buena Vista with encouraging prospects. The Trenton mine is now regarded as one of the best. A lot of the ore lately shipped to San Francisco netted \$100 per ton. The Battle Mountain mill was expected to start up on ore from the Little Giant. In addition to milling ore of a low grade, they have struck sulphuret ore which assays \$500 to the ton, and is sacked for shipping.

Frank Cole and E. D. Kelley have struck a ledge which is probably a continuation of the famous Arizona.

WILL START UP.—We understand water will be turned on the new tailings mill of the Arizona Consolidated Co. to-day.

CONTRACT.—A contract was let a few days ago on the old Whitmore mine, in Star district. This is the second extension south on the Sheba ledge.

WILL COMMENCE.—Work will be commenced next week on the tramway from the Arizona mine to the cañon, 1,800 feet below.

RAILROAD DISTRICT.—*Elko Independent*, June 10th: C. E. Gillett is opening out the Bullion mine with a large force of men. The Wehfoot has a shaft down 25 feet, showing ore worth \$75 per ton. Last Chance has an incline 60 feet deep, showing a chamber of ore nine feet wide. E. V. Robbins owns it, as he does also the Shoo Fly, which is giving out high grade ore. The Hussey tunnel has been commenced 600 feet below the top of Bunker Hill, to prospect the True and Red Jacket mines. Upon the last-named there is a 45-foot shaft, following down a 4½ foot vein of first-class ore. The May Flower shows ore worth \$60 per ton, to smelt. The Lyon has an 8-foot vein, well defined.

WASHOE.

BULLION.—Enterprise, June 6th:—There were yesterday received at the Bank of California, 36 bars of bullion, worth 76,000. This was principally from the Crown Point and Yellow Jacket mines.

Same of 7th:—There were yesterday received 12 bars of bullion weighing 1,252 pounds and worth \$40,090. The bullion was from Crown Point and Yellow Jacket ores.

SAVAGE.—The daily ore product is 125 tons. The work of re-opening the old levels is vigorously prosecuted.

HALE AND NORCROSS.—This mine is producing 100 tons of ore daily. Much work is being done in the lower level preparatory to sinking the new incline.

MORE BULLION.—Same of 8th:—Crown Point bullion, amounting to \$19,000, was yesterday received at the Bank of California.

PARKE & BOWIE MILL.—A new Parke pan, eight feet in diameter and six feet deep, is being set up. It will work over eight tons of tailings at a charge.

CHOLLAR BULLION.—The Chollar-Potosi day before yesterday shipped \$86,000. The mine is yielding 200 tons of ore per day of the average assay value of \$62.

CARSON VALLEY TAILINGS CO.—A number of persons under the above name, are engaged in the erection of extensive works in the Carson river, at the mouth of Six-mile Cañon, for the working of tailings. They own a reservoir containing over 300,000 tons of tailings. The mill will contain ten Parke pans eight feet in diameter and six in depth—each capable of working fifty tons of tailings in twenty-four hours.

KENTUCK.—The Co. are taking out forty-five tons of ore per day, from between the 600 and 700-foot levels.

ATLANTA.—The Atlanta Mill Co. Gold Cañon, are about to set up two of the eight-foot Parke pans.

YIELD OF THE CROWN POINT FOR MAY.—Same of 10th:—During May there were reduced 6,516½ tons of ore yielding \$275,647.95, or at the rate of \$42.30 per ton. There are yet thousands upon thousands of tons of equally good ore in sight.

OPHIR.—Same of 11th:—The Co. are progressing at the rate of two feet per day with the sinking of their engine shaft. The shaft has attained a depth of 765 feet, and it is the intention to continue it to 1,400.

CONSOLIDATED VIRGINIA.—The drift south from the main west drift, is in fifty-seven feet and a cross-cut to the east twenty-seven feet in length has been made—all in good looking quartz. The north drift is also in quartz presenting a favorable appearance. But little water is encountered.

SUTRO TUNNEL.—The tunnel was in yesterday 2,085 feet. The ground works well.

OVERMAN.—This mine is still yielding ore, mostly from the 226-level. There is no pay ore on the 600 or 700-foot levels. In order to make the mine permanently valuable it will be necessary to sink several hundred feet deeper.

BULLION SHIPMENT FOR MAY.—TWENTY-FIVE TONS OF SILVER BARS.—Same of 4th: The amount of bullion shipped from Wells, Fargo & Co.'s office to this city, during May, was 664 bars, weighing 49,838 pounds, and worth \$1,148,787.53.

WHITE PINE.

REVIEW.—News, June 10th:—At the Ward Beecher, notwithstanding the tramway has been running steadily all week, the huge piles of ore on the surface seem to have suffered little diminution. The mine continues to ship a large quantity of first-class ore to the Oasis mill. The tramway has been running splendidly, carrying ore from the Eberhardt & North Aurora to the International mill, which is running steadily to its full capacity. The affairs of the Eberhardt & Aurora Co. have assumed a shape to enable the thorough working of the mines. They have been running the big mill on low-grade ore, but have a lot of amalgam on hand which will shortly be ready for shipment. Original Hidden Treasure has an immense amount of high-grade ore piled up ready for shipment. Governor Blasdel is getting things in shape on the Ward Beecher Consolidated. The Manhattan mill has started on ore from this mine, and it is the intention to start the Dayton shortly. The Stanford mill has shut down for repairs, but the mine is looking as well as ever. Work on Chloride Flats is retarded, through conflicting titles; but these will be amicably adjusted ere long. We have very encouraging reports from many of the outside districts, among which may be mentioned Troy, Grant, Tybo and Schell Creek.

TROY S. M. CO.—This Co., (limited) English, will start its 20-stamp mill and a

Stetefeldt furnace of 30 tons daily capacity, on or about the 1st of August.

Arizona.

THE TIGER LODGE.—The Prescott Miner of May 27th says that Messrs. Bradshaw and Walker claim that they have found the continuation of the vein three miles south of the Silver Brick Co.'s location. Others think the War Eagle, seven miles off, is the same lode, and it is believed by Mosses, Collier and Co. that the Mammoth, discovered in '65, some five miles farther south, is still the same lode. Everything is lively, and everybody sanguine.

The Vulture Co. have five men taking out rich ore from the "Great Sixton" mine.

Idaho.

ITEMS.—Avalanche, June 3d: Jno. McNamara has a hydraulic in Barnes' gulch, below Boonville, and is doing well. Fred Warnke brought over a batch of bullion from Flint this week. The Webfoot mill will start up next week on Oro Fino ore, and will pound away all summer. Shuster & Co. are running two hydraulics in their Blue Gulch placer claim. The bank is 15 feet deep, with a face of 60 feet and pays well throughout.

BULLION.—Wells, Fargo & Co. shipped this week 10 bars of bullion, worth \$21,536.56, making an aggregate of \$62,155.88, shipped during May.

New Mexico.

The Colorado Register has interviewed Dr. B. W. Cheever, just returned, (June 7th) from New Mexico. We give a few items as briefly as possible. The mines about Silver City are pockety. Dr. C. gave up his idea of putting up a mill. The Burro mines, 40 miles south, he did not visit, but from assays and reports he believes the ore would not average over 30 ounces per ton; they are, however, true veins, and very wide. The nearest water is the Rio Grande, 15 miles off. The Harpending Co. and the California Co. have ceased operations.

Oregon.

GRANT COUNTY.—Cor. of Dalles Mountain, June 3d: M'Coy & Co. on Spanish Gulch, near Rock creek, have recently opened a very rich, and to all appearance, extensive placer of gold, which will require years to exhaust. The Co. possess a valuable water right in connection with their mine, and have constructed a ditch seven miles in extent—tapping Rock creek which affords water the entire year for hydraulic work, and for four or five months of the year eight hundred to one thousand inches of water.

Montana.

ITEMS.—Helena Gazette, June 5th: The French Bar Ditch Co. made a clean-up on Monday of six boxes of their flume, after a run of two weeks, and took out \$5,700. On Monday S. Cameron came in from Cahle City bringing with him 315 ounces of gold, the result of a run from 120 tons of quartz from the Cable mine. Jefferson City furnace is to be running soon. Ten tons of bullion was run out in a month and sent East to be cupelled.

ITEMS.—New North West, 2d: The Phillipsburg mill was only started up to run through a small lot of quartz on hand. Seventy men working in French Gulch. Milot & Co. started their hydraulic yesterday. Water plenty. The clean-ups at Pilgrim Bar and Pioneer on Sunday ranged from \$1,000 to \$3,000—rather light. The Rock Creek Co.'s Ditches are carrying 2,340 inches of water, the largest amount ever "tapped" on Pilgrim Bar. The Only Chance, and Nevins Co., at Red Mountain have their arrastras running. Both mines look well. Mr. Jos. Alger came in last evening from Phillipsburg. He made a run of twenty-two tons of Phillipsburg ore and has 256 pounds of bullion valued at \$4,500 to show for it. There is more water in Elk creek than since '66. The companies in the main gulch are making from \$6 to \$50 per day to the hand; pay streak 50 to 150 feet wide. Jones Midgah & Co. have an ounce a day to the hand in the big flat below Yreka, with 18 feet to bed rock and 4 to 5 feet of gravel. They have worked the pay streak sixty feet and haven't found the edge yet. They have 2,000 feet of ground.

The Montanian of June 1st says that Mr. Johns, Supt. of the Everett-Green Campbell Co. brought to town 20 pounds of gold retort, proceeds of one month's run of the Co.'s mill.

The Missoula Pioneer of June 1st says that claim-owners in Henderson Gulch, are making \$22 per day to the hand clear of all expenses.

Mining Stock Market.

[S. F. Stock and Exchange Board.]

SAN FRANCISCO, Thursday Eve., June 15.

The effect upon speculative values of last week's heavy transactions has been noticeable this week.

As effecting values, during last week to Friday, 9th, 200 tons ore was taken from the Overman mine, assaying \$16.72 per ton. The bullion product at the Raymond & Ely mine, from May 24th to June 7th was \$37,500 from a mill of 20 stamps; the last weekly report of the Hale & Norcross mine, (June 6th) shows 1,044 tons ores extracted, while from the Savage mine 1,080 tons were taken; the last named assaying \$32 per ton; and during the same week, 1,660 tons were taken from the Chollar-Potosi mine, assaying \$56.20 per ton. Bullion shipment on Saturday, \$10,755.

During this week to Thursday June 15th, 230 tons of ore was taken from the Overman mine. From the Eureka mine at Grass Valley \$23,000 has been received.

The sales at the Stock Board for the preceding week ending Friday, June 24, footed up \$2,319,000, the tone in general of mining stocks having been good. On Friday the 9th, there was a stronger demand for Virginia stocks at prices from \$5 to \$20 higher per share.

During the present week stocks were, on Monday the 12th, irregular; half of the Virginia stocks declining again from \$1 to \$10 (Crown Point) per share.

From the Crown Point Annual Report the moneys produced or used figure up:

Amount of bullion produced.....	\$472,181 48
Premium on the same.....	474 92
Assessment No. 20.....	36,000 00
Assessment No. 21.....	43,000 00
Rhode Island mill.....	11,034 63
Sundries.....	11,777 19
Total receipts.....	\$573,468 22

On Wednesday, 14th, the Stock market opened with some activity and prices were strong. At the Afternoon Board the market was pretty active. Belcher rose \$13; Kentucky, \$10; Hale & Norcross, \$2. Eureka fell \$12; Chariot, \$1; Gould & Curry, \$4; Hidden Treasure, \$1.

As we go to press (16th) stocks are "a little off" though for two months the share market has been unusually active; the totals for April amounting to \$10,000,000 nearly, and for May to \$13,000,000 which would be at the unprecedented rate of \$136,000,000 per annum.

The First Telegraphic Instrument.

An interesting relic of the early days of telegraphy has, it is said, been discovered at Morristown, N. J. It is the first instrument by which messages were received and sent by the aid of the electric current. When Professor Morse was experimenting on the power and capability of electricity as applied to the transmission of words, he spent a large portion of his time at Morristown, where he was assisted by Alfred Vail, Esq., a practical machinist and inventor. At the Speedwell iron works of that town, then owned by the father of Mr. Vail, the experiment on the wires and on the construction of suitable instruments took place. "On the completion" of the experiments and the removal of Mr. Morse to Washington to bring his invention before Congress, Mr. Vail accompanied him, and, receiving the appointment of assistant-superintendent of telegraphs, was stationed at Baltimore at that end of the experimental line. The instrument now at Morristown was one of two taken from Morristown by Morse and Vail—Morse using one at Washington and Vail the other at Baltimore. The first message sent was the now well-known, "What hath God wrought," which Morse transmitted to Vail; but the first public message was the news of the nomination of Polk to the Presidency, by the Baltimore convention of 1844, sent by Vail to Morse. These instruments were in constant use for six years, when Mr. Vail, returning to Morristown, brought his with him, and where it has since remained in the possession of his family. Mr. Vail dying soon after, his instrument was specially left, by a clause in his will, to his eldest son as an heir-loom, while parts of instruments made during the experimental trials were left to Prof. Morse, with a request that he would give them at some future day to the New Jersey Historical Society. The old instrument works as well as when first made, and Saturday a message was sent to New York, and a reply received at Morristown. An excellent photograph of the instrument was also taken, and with it a visit was made to Prof. Morse, in New York. The professor was delighted to see the representation of the first instrument, having destroyed, as he said, the fellow instrument which he had used in 1844. He readily recognised it, and wrote a certificate across the picture as to its being a true photograph of the first instrument ever used to transmit public messages. He also expressed a wish that

the photographs might be generally distributed, that it might be seen how little, in essential points, it differed with those now in use. With the exception of size and clumsiness, the instruments are almost exactly similar. The dimensions of the instrument are sixteen inches in length, seven inches in height, six inches wide, with two magnets of three-inch diameter. The paper used was two and a half inches in width, three pens being proposed to be used. The weight of the instrument is twenty pounds. —*Ex.*

Editorial Notes Eastward.—6.

Desert, Lake and Mountain.

I awoke in the morning in a new region. In the night we had passed from the grand Sierras, had run along the beautiful

and its waters, at first pure and sweet, are said to become brackish and impure as they roll on.

Humboldt forms an oasis in our desert. At Mill City we are reminded of a proposed narrow-gauge road to the mining town of Unionville. Winnemucca, we are told, was once a stirring, hustling "stamping ground," and beyond it we meet a relic of its former times, the Humboldt Canal. Battle Mountain is an important point, if for no other reason to the traveler than as being an eating station. Beyond Beowawe, the Maiden's Grave, denoted by a cross, is pointed out to us, and the end story is told of the young girl fading away on her westward journey. And so we

all places of interest in and about it. We extract from the introductory remarks, the following description of

A Trip into the Country.

What is it? Well, perhaps the cure of a cold, the roasting out of a rheumatism, the pasting up of tattered lungs, one more ehuffle for life; perhaps an escape from odorous offices, ugly rows of figures, stagnations and lawsuits; an armistice, perhaps, in home affairs, a pause of the treadmill, a shifting of position, a momentary stillness in the storm; a brief escape, it may be, from arbitrary affection, from tintured sweetness, from loves abrasions; perhaps it is a packing up of fitting heart-treasures, the wooing back of a gentle life; the last stake, which, when lost, leaves, in place of sweet fulness, a long, deep, noisome cavern.

But what is it? It is a towel after a bath, a thawing out of the eye-tem, oceanic distillation, extraction of neuralgia, physiologic solar lubrication; a coming out into broad sunlight and soft air; amid the ringing songs of birds; the music of brooks, and sweet flowers; out into the wild woods, over foaming streams, and out upon smooth lakes. It is taking a glance upward, a slipping of the fetters, a flash of the spirit into unwonted regions, a square look into the past and into the future. It is a renewal of the lease for another year, an extension of time on the part of our common creditor.

This book is furnished at the very low price of 75 cents. It will be found an invaluable requisite for tourists in California.

NEW MAP OF CENTRAL CALIFORNIA; Revised and Enlarged by A. L. Bancroft & Company, San Francisco.

As an accompaniment to Bancroft's Tourist's Guide to "The Yosemite and Around the Bay, South," and "The Geysers, and Around the Bay, North," we have here a revised and enlarged map of the central portions of the State, embracing all the railroads completed, or in early contemplation, and showing distinctly the great routes of travel described in the Guide Books above cited. Strangers and others in California will find this a very complete and perfect pocket map of all the central portions of the State. Price 75 cents.

PLASTICITY OF ROCKS.

The old cobble-stone pavement in Waverly Place, between Broadway and Mercer street, being now in process of removal, my attention has been drawn to the forms of the stones, especially the harder ones, quartzites, etc. The coarser granulated paving stones have generally crumbled, but the compact stones have been modified—convex surfaces in one case fitting into concave in another; none of them retaining a normal form. Now, although the crown of these stones has been worn by the attrition of constant and heavy travel, no such wear can have taken place on their perpendicular surfaces, and I am therefore convinced that they have been molded into one another by pressure only. On conversing with the workmen, they all concurred as to the fact, and the foreman stated that his attention had been called to it before. Very probably I am myself only repeating what is already well known to others.—George Gibbs, New York.

Quite a number of distinguished foreign personages are at present sojourning in this city.

TRUCKEE RIVER.
276 miles from San Francisco—Altitude 6,100 feet.

Truckee river (the pride of Nevada and justly esteemed most highly) for some sixty miles, had crossed this stream no less than five times, had left the noble trees and the bounding river behind us. Peeping out of my sleeping-herth window, my eyes met the sun appearing above the mountains east of the "Great Sink of the Humboldt." These mountains were set in deep blue, the near hills shadowed with brown. The waters of the lake at that

TRUCKEE RIVER.
276 miles from San Francisco—Altitude 5,044 feet.

instant appeared mirrored with silver with gleams of gold, and beautified with lively colors, with the many harmonizing hues of Nature's grand morning scenes o'er mountain, desert and lake. Probably this view is a rare occurrence, for here I expected to see only a tameless slough and a weary desert.

But we find another companionable stream, the Humboldt, largest and longest of rivers in Nevada, our traveling companion for two hundred and fifty miles. We traverse with it a dry and sterile land, which it lightens up, however, here and there with shrubs and grasses. But our friend is said to degenerate as it advances,

ENTERING THE PALISADES.
270 miles from San Francisco—Altitude 4,800 feet.

travel on through the morning and noon, and find points of interest, pleasing flow-ers, in our desert, and come to Palisade.

New Publications.

BANCROFT'S TOURIST'S GUIDE.—The Geysers, San Francisco and around the Bay, North San Francisco. A. L. Bancroft & Co., 1871.

This is a neat little duodecimo volume of 220 pages, which provides a complete key to one of the most attractive and won-

PLEASANT VALLEY.
300 miles from San Francisco—Altitude 4,500 feet.

derful spots of all the wonderful localities in California, and one which, when properly known, will become one of the most popular resorts for tourists upon the Pacific Coast. Nowhere in this State can so much be seen in so short a time or in so short a distance of travel, as in and about Calistoga, the Geysers, Clear Lake, etc. The book before us furnishes a complete guide to and through all these localities, as well as full descriptions of the Napa, Santa Rosa, Petaluma, Sonoma and Russian river valleys. It also furnishes a short historical sketch of San Francisco, a topographical description of the city and its surroundings and a complete guide to

POPULAR LECTURES.

Deadly Weapons and Fire Arms.

[Prof. WELCKER before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

LEC. II., June 10. There was the usual large attendance of students and others on Saturday evening last, to listen to Prof. Welcker's lecture, giving an historical resumé and descriptive account of deadly weapons of all sorts, ever devised, including fire-arms, down to their recent most effective improvements in the Henry and Winchester rifles. Amongst the distinguished visitors on the dais, we noticed Governor Haight.

Slings, axes and swords, ending with the bow, embraced the whole subject as gone over, down to the times of the early colonists of America, who must have used the bow largely. In the use of the sling the inhabitants of the Balearic Islands are historically accredited with great reputation for expertness; and the English were the most famous bowmen; a man who could not put a dozen arrows into a ten inch plank in two minutes was no bowman at all. The point which gave archery its grand priority was the invention of the feathered end directing truly the weighted point. The sworded Roman soldiers under Julian found the Parthian archery terrible to encounter. The cross-bow was a great improvement; it was introduced into England by Count de Leon, and serving to defeat the Saxon archers, became the instrumentality of the formation into the existing character of the English language. Lead at the point of a bolt was the incipient bullet. One chief defect of the cross bow in warfare was the fact that it spread the men apart so as to make a body so armed less effective against cavalry; hand-arms continued, accordingly, to be most valued. The bucklers, cuirasses and mailed clothing hitherto worn by both infantry and cavalry, were dispensed by the introduction into warfare of

Fire Arms.

Various names, such as bombard, etc., were given to the same weapon, a gun barrel mounted on a trestle, weighing 25 to 70 lbs., and operated by two men. It had a decided effect, as nothing could withstand them; in 1330 they were in general use. Even as long ago as that breech loading cannon came into common use, but they were not efficiently secure from accidents and were rejected as too dangerous to the owner himself.

[The lecturer here gave several diagrams on the blackboard showing the early manner of mounting and serving such guns as were too heavy to be worked without supports; but the time is too short to have them engraved, in season for our present issue.—EDS. PRESS.]

From these the step was simply to the use of a mechanical match holder, whereby the gunner could fire more accurately by simply touching a trigger.

And from that to the Nuremberg wheel and flint lock, and the very greatly improved modern flint lock that existed down to our own early days.

Short-hand guns were made in the town of Pietor in Tuscany; hence *pistols*.

Rifled arms were known as early as the 15th century; and the sling and cross bow were themselves not abandoned until 1560; the English clung to the bow until 1427, on account of their expertness in its use. It took some time for the flint to push out the match lock.

The first and second ranks were now armed with pikes, and and three or four ranks behind them were armed with muskets; afterwards three ranks in all were in vogue, bayonets displacing the pikes. In the U. S. there are now but two ranks.

Gustavus Adolphus, of Sweden, the hero of the Reformation wars increased wonderfully the rapidity of fire by inventing cartridges; and Forsythe, an English clergyman, added percussion caps. The latter rendered the bullet of the rifleman much more certain, prompt, accurate, and powder practicable in any weather, even in the heaviest rain. The fulminating material which creates the spark is made of two parts mercury and one saltpetre; a

compound having the peculiar characteristic of exploding when struck with the hammer.

The problems of increased range, rapidity of fire, and increase of accuracy were vigorously worked upon by numbers of ingenious men—aiming to strike the enemy more surely further off, and more frequently, until the accurate weapon developed in America and known as the American rifle, culminated in the Miuie, the Needle, the Chassepot, the Henry and the Winchester weapons; involving much scientific acumen in such problems as the burning of all powder, or the prevention of windage by means of patches, expanding balls, etc.

The conical ball was brought to the accuracy of direction of the feathered arrow by means of grooves at the back end, which were taken hold of by the atmosphere in such a manner as to push the deflecting stern always back into the true axis of flight; without this the terrible conical ball would be subject to failure.

Colt in this country, and Adams in England, adopted revolving arms; and amongst the repeating rifles, the Spencer, invented in 1860, has a magazine for seven cartridges, and the Henry, 1862, for fifteen. The latter fires 30 times a minute without haste, viz.: twice as fast as the Spencer, and six times as fast as the Prussian Needle-gun. The Winchester is an improvement, in practical points, upon the Henry, was unanimously adopted by the Swiss board of experts on arms as against all others invented; and may be used as an ordinary single-shot breech-loader, with a reserve at hand of fifteen shots whenever required.

The Pyramids of Egypt.

Among the seven wonders of the world have usually been counted the pyramids of Egypt, but, from late investigations by Mr. Piazza Smyth, several of the popular ideas concerning them appear to have been erroneous. He regards the Great Pyramid of Cheops as the oldest monument in Egypt, while the other pyramids were built afterwards. This is also the largest and finest, and the only perfect one in architectural design and execution. Nothing has been constructed during the 4,000 years since it was completed that can vie with this colossal pile. Even our largest and finest specimens of architecture are inferior in height to this ancient relic of the Nile. St. Paul's church, in London, is 360 feet 2 inches high; St. Peter's, at Rome, 432 feet; Strasbourg Cathedral, 468 feet; while the Great Pyramid is between 435 and 495 feet in height.

The pyramids in general are supposed to have been built by successive generations, each layer of the masonry answering to the reign of a king; but that of Cheops is probably an exception to this rule, for it is uniform in its architecture and building materials. Mr. Smyth says it must have been built from carefully prepared plans, and the whole structure was completed by its founder after hard labor for twenty years. Mr. Smyth does away with the old theory that the Great Pyramid was intended for a tomb.

The burial chambers of the old Egyptian kings were nothing but whole suites of apartments, gorgeously carved and inscribed with emblems of self-glorification. But the one pyramid of all, in which we should expect to find the most elaborate of these inscriptions, is entirely lacking in them, and it contains only plain geometrical surfaces of exquisite workmanship, the stones ground to true mathematical figures, with joints inconceivably fine, and thin as tissue paper.

Instead of its being founded on the alluvial mud of the Nile, as is generally supposed, the Great Pyramid is discovered to rest on a "hill of compact limestone, at a level of about 100 feet above the alluvial soil of Egypt, and to one side of it." Moreover, a curious fact is, that the stones in the British Museum, supposed to have been taken from this pyramid, have been found by careful measurement of their angles of slope, and comparing them with the original structure, to have never belonged to that famous building.

CONDENSED soda water is the latest novelty. It is put up in boxes, containing material for 16 glasses of as pure soda water as can be drawn from any fountain. The powder is charged with gas, sweetened and flavored with pine apple, etc., ready for use.

GOOD HEALTH.

Pork and Alcohol Bad for Consumptives.

EDITORS PRESS.—It has long been known in the highest scientific circles, that two, at least, of the ingredients that go to make up the diet of two-thirds of the people are entirely inadmissible in all pulmonary difficulties—viz.:—Pork in one shape or another, and alcohol. I do not propose to enter into any lengthy dissertation, but simply give some facts in my experience that bear upon the point.

In 1861, while on my way across the Plains with my family, bacon was our main stay; but losing the larger part of our team near Green River, we were compelled to abandon the heavy wagon and the largest part of our stock of bacon, so that by the time we reached great Salt Lake City, it was all used up. It was well; for by that time a bad humor caused festers to appear at the roots of the nails, so that they all came off; and otherwise endangered the general health, to such an extent that I was not at all sorry that the bacon was gone. From that time until the present, I have not used ten pounds of pork or lard, and no appearance of the return of the disease has been manifested, my general health has continued steadily to improve until, physically, I am an entirely different person from what I was under the pork regime.

Now about alcohol; and in speaking of that stimulant, I might include most others of an ultra nature; especially those that have an undue action upon the heart. I have always noticed an increased tendency to cough where they were used. The mechanical conditions violated by any introduction of like stimulating substances into the system, must be obvious when we consider that an increased action of the heart only increases the difficulty by throwing more blood to the lungs than they, in their weakened condition, can either oxygenate or expell, causing of, course congestion and consequent irritation in that much abused organ.

By what mode of reasoning one can arrive at a conclusion that benefit can be derived by the introduction of almost pure carbon, to increase the labor of an already outasked organ, I am at a loss to perceive. Every one knows that the carbonaceous matter in pulmonary difficulties is not deposited in the shape of fat, or at least it ceases to have that tendency in the latest stages of the disease. What then becomes of it? it certainly is not eliminated by the lungs. The only conclusion we can come to is that it returns in the circulation to add obstruction and inflammation; where there should be an opposite tendency. How long will the thinking world submit to be humbugged by eopisms a child might laugh at?

To get well, if one has a tendency to a pulmonary or you might add any other disorder; it is only necessary to weave the tissue of our organisms out of proper material so that it will not tear! and abandon the use of those narcotic and stimulating substances that tend either to lethargy or unnatural activity. F. M. SHAW.

San Diego South, Jan. 22d, 1871.

Wearing Flannel.

In the climate of San Francisco, and wherever the cold sea breezes prevail during the summer, flannel ought always to be worn. If the ladies, especially the young ladies of this city, could be induced to regard the laws of health in this particular, many precious lives might be saved; but pasteboard soles, low-necked dresses and lilliputian hats are pretty sure to sow the seeds of a fatal harvest. The suggestion in the following paragraph from the *Scientific American*, if followed, might save much sickness and suffering, and not a few from untimely graves:—

Put it on at once. Winter and summer, nothing better can be worn next the skin than a loose red woolen shirt; 'loose,' for it has room to move on the skin, thus causing a little tillilation which draws the blood to the surface and keeps it there; and when that is the case, no one can take cold; 'red,' for white flannel fills up, mats together, and becomes tight, stiff, heavy and impervious. Cotton-wool merely ab-

sorbs the moisture from the surface, while woolen flannel conveys it from the skin and deposits it in drops on the outside of the shirts, from which the ordinary cotton shirts absorb it, and by its nearer exposure to the air, it is soon dried without injury to the body. Having these properties, red woolen flannel is worn by sailors in the midsummer of the hottest countries. Wear a thinner material in summer.

Necessary Rules for Sleep.

There is no fact more clearly established in the physiology of man than this, that the brain expends its energies and itself during the hours of wakefulness, and that these are recuperated during sleep. If the recuperation does not equal the expenditure, the brain withers—this is insanity. Thus it is that, in early English history, persons who were condemned to death by being prevented from sleeping, always died raving maniacs; thus it is also that those who are starved to death become insane, the brain is not nourished and they cannot sleep.

The practical inferences are three: 1st. Those who think most, who do the most brain work, require the most sleep. 2d. The time "saved" from necessary sleep is infallibly destructive to mind, body and estate. 3d. Give yourself, your children, your servants, give all that are under you, the fullest amount of sleep they will take, by compelling them to go to bed at some regular, early hour and to rise in the morning the moment they wake; and within a fortnight, Nature, with almost the regularity of the rising sun will unloose the bonds of sleep the moment enough repose has been secured for the wants of the system. This is the only safe and efficient rule; and as to the question how much sleep any one requires, each must be a rule for himself—great Nature will never fail to write it out to the observer under the regulation just given.

Disease and Carelessness.

There can be no doubt that carelessness is the origin of most diseases. Medical men also hold that foolish people who follow their own whims have hardly a chance of recovery when visited by serious disease. Nine-tenths of the doctor's work would be done if people were only consistently prudent and cautious. Only it is so hard to be habitually cautious. On abundant occasions a man may be most elaborately prudent, and then, to his utter astonishment, he dangerously imperils his health by some startling impropriety. When he has used every imaginable pains he is always amenable to the force of accident. There is another plausible theory, antagonistic to the one we have named, to the effect that every man has the seeds of some particular disease in his constitution, and some trifling accident will come, sooner or later, which will have for him the same effect as a match falling upon gunpowder.

Medical men explain this on theories of constitutional tendencies or of some poison latent in the system. The fatal accident to one man is the merest accident for another. Two men while walking get well soaked by the rain. One man shakes off the water pretty much as a dog or a duck might do, and rather enjoys his shower-bath than not. Another man is taken ill of inflammation of the lungs, and probably dies. The doctors cannot explain the different issues, and they would also be very much puzzled to give a satisfactory account of the pneumonia itself. They will, indeed, generally explain theories more or less plausible, and practice has been built upon theory, and theory has, no doubt, sacrificed a number of lives. Yet medicine must have its dogmatic system, and without it medicine becomes little better than empiricism.—*London Society*.

OPPOSITION TO VACCINATION IN INDIA.—The natives of the Northwestern Provinces of India objected to vaccination for the following reason:

'They believe that a native child is to be born whose destiny it will be to drive the English out of India and then to conquer the world. This child is to be distinguished from other children by having milk, instead of blood, in its veins. The natives believe that, by vaccination, the English are seeking to discover the wonderful infant, so as to imprison or kill him.'

WIND IN THE STOMACH.—A physician, in a very sensible article, on bathing, recommends a more general use of warm baths instead of the syrups and worse nostrums for the wind in the stomach, which is thought to be so often the cause of the worrying restlessness of very young children.

The Audience and the Lecturers at the Mechanic Arts College.

Prof. Welcker at the conclusion of the last lecture (on weapons) before the Mechanic Arts College, said: Before I leave the stand, ladies and gentlemen of the Mechanics Art College, I desire to thank you very heartily for the patience and courtesy with which you have listened to my discourses heretofore. My colleagues who have preceded me in this series of lectures have spoken unanimously of the very agreeable conduct of this audience. Some of them have stated that they have addressed audiences upon similar subjects in almost every part of the Union, and they have never anywhere met with such respectful attention; in short, that they never have had so good an audience as they had found in the students and visitors of the Mechanics Arts College in San Francisco. [Applause]. Now these gentlemen here have addressed you upon subjects which in themselves are of the highest interest, and of interest to everybody; and if they have occasion to remark this, much more have I.

I do not flatter myself that the remarks which I have made here have had sufficient interest to enchain your especial attention; but accepting it as a deliberate test of your courtesy and good breeding, I thank you very heartily. [Applause].

THE NEXT HORTICULTURAL EXHIBITION, which will come off in August next, in connection with the Mechanic's Institute Exhibition, will eclipse anything of the kind yet seen on this coast. As the exhibition will be continued four weeks, instead of one, the usual length of such exhibitions, and will consist in a large measure of perishable articles, it will require much labor and sacrifice to keep it up through the term; but we doubt not the necessary public spirit and sacrifice will be found among those who have the means to furnish the material.

OUR TRAVELING AGENT, Mr. W. H. Murray, now on his way back from the Atlantic States, will spend a few weeks among our friends and patrons in Colorado and Salt Lake.

Industries, Employment and Business.

A look through the Mission Woolen Mills, and a call at one or two of the foundries, suggest points expressive of "the situation" of life and business in the West. Labor on the Pacific is now at a par with that of the East, no higher in the average, and no lower; by which remark we do not mean skilled white man's labor alone, but skilled and unskilled white man's and Chinese alike. The fact is proven by the history of the woolen mills. The two in this city have been running uninterruptedly for eight years and are running at their full capacity to-day. The Mission Mills employ 400 hands altogether, and the money paid on labor account is as near that for equal products in the East as can be, low enough in comparison to warrant the dictum that there is "no difference," which means in this connection that with the Chinese here the sum total may be even a little lower. Boys and girls, wages are the same, but expert white hoes and masters in the trade get about \$1 a day more here than they do in the East.

In such enterprises as the reclamation of swamp lands by ditching an example of the influence of the presence of the Chinese is seen in the offering of the contract by Dr. Toland on Friday last for 4½ miles or 163,000 yards of leveeing at Collinsville; the contract being taken by a Chinese company at \$20,000 which was \$6,000 less than any bid for white labor; or say 11½ cents per yard after allowing \$1,255 as a margin for incidental expenses and profits.

After all the talk about woolen mills, there are only five in the State—the Mission, North Beach, Merced, Marysville and Sacramento—of which all but the last have been running successfully and constantly from their completion; and the failure of the Sacramento mill is attributed to loose calculation and management. The fact that the same wool—the staple having risen 50 per cent. this year, from eastern or general causes, cost the Mission mill \$180,000 for last year's consumption, and \$300,000 for this, without disastrous effect, proves the soundness of industries of the sort on the coast.

It should be understood that traders—the Jews principally—always prefer to sell eastern goods of every sort at less profit, arising from their trade connections, in which they share with the eastern or European producer the profits of the cheapest labor, and of speculations in the market.

In hoot and shoe manufacturing, co-operation has been applied, since the disagreements between employers and employes about two years ago. The importation of men's eastern-made hoots—chiefly Benkert's, of Philadelphia—has been reduced one-third or more within two years, on account of goods manufactured in this city. The importation of eastern-made woman's gaiters has declined fully 50 per cent. within the same time, the home article being preferred, both as to price and quality, to the gaiters of Atlantic manufacture. The workmen make better wages here than are paid by the leather lords of the hoot trace in Lowell and other Atlantic cities, while flour, vegetables, meat and other mainstays of physical life, are both cheaper and better here than the workmen of the East are accustomed to.

In the iron works the freezing aspect of the past two years is nearly gone. Always the best key to healthy or unhealthiness of business life and individual prosperity, we see that with a greater plenitude of general orders everywhere at the Empire Foundry there is a beginning in the manufacture of portable ranges and stoves, a business heretofore deemed entirely impracticable here in consequence of the dearer labor; the freight on a stove via Cape Horn being but a trifle. At the Miners' Foundry, which suffered in our late "dullness" with so many other of the most meritorious establishments, co-operation has

solved all difficulties as it even will in lieu of a reluctance capital.

In printing, without stopping to more than allude to the two leading co-operative firms, male and female, one fact is indicative of the times—that the excellently manufactured value of Bancroft's Tourists Guide north of the Bay, of 227 pages 12 mo. could be gotten out and sold here, and now for 75 cents.

The fields for labor are the fields where the capitalist's dividends are paid; and while it is well understood that our capitalists are generally capitalists from their talent for "holding on" to what they have gotten by good fortune, rather than by reason of their shrewdness, the limits of the present article do not permit of any comment upon the unoccupied fields.

Farming is usually considered the most easy, ready, sure and profitable in the end to those without capital. Farming must have its market, and without cheap transportation for small articles in the local markets, or without local markets, farming becomes either planting, or hibernating, and has serious drawbacks. Farming in the far west is not so easy to begin and carry on successfully without considerable capital, as it is in the Mississippi west.

On the subject of speculation, an old and new York business man makes the following hypothetical table, estimating the chances on ten year's active use of brains and capital in the chief sources of speculation extant, omitting speculative mining:

Start fifty educated business men, twenty-five years, and supply each of them with \$20,000 to use for ten years, and at that period to report their actual position. The probable returns would be:

In stocks—One man at the end, would be worth \$200,000; two men, about \$40,000 to \$50,000; two men, about \$20,000 to \$25,000; forty-five men bankrupt.

In grains and western produce—One man, \$100,000, one, \$75,000 to \$80,000; three, \$50,000 to \$75,000; five, \$40,000 to \$50,000; ten, \$25,000 to \$30,000; ten, \$10,000 to \$20,000; twenty men bankrupt.

In cotton—One man \$150,000; one, \$100,000; one, \$75,000; five, \$40,000 to \$50,000; three, \$30,000 to \$40,000; ten men, \$5,000 to \$10,000; twenty-nine men bankrupt.

In sugars, teas, and foreign produce; one man, \$150,000; one, \$125,000; one, \$100,000; three, \$60,000 to \$75,000; five men, \$40,000 to \$50,000; four men, \$30,000 to \$40,000; ten, \$20,000 to \$25,000; ten, \$10,000 to \$15,000; fifteen men bankrupt.

In real estate (the writers own choice after failure in everything else), one man would, at that period, be worth about \$200,000; two men, \$150,000; five, \$100,000; ten, \$50,000 to \$75,000; ten, \$40,000 to \$50,000; ten, \$30,000 to \$35,000; ten men, \$10,000 to \$15,000; two men bankrupt.

A similar table in regard to more legitimate productive industries, not excepting legitimate mining, may be made by anybody for himself.

What Becomes of the Sulphur Used upon the Grape Vine?

This question has been answered by Prof. C. Wideman, in the New York *Journal of Applied Chemistry*, who says that recent analyses of the soil taken from the foot of vines which have been treated with powdered sulphur, shows that the sulphur so employed, after performing its office of warding off disease to the leaves, falls to the ground, and unites with the lime there to form sulphate of lime—gypsum—the substance now so highly recommended for its fertilizing or rather irrigating qualities. This sulphate of lime has been found at a depth of fully three feet from the surface, and under circumstances where no other probable origin can be thought of. The transformation is thought to take place within a period of one month from the time of putting the sulphur on the vines. This important fertilizing result affords an additional reason for the use of sulphur on the vines, and wherever else it may be of use in destroying insects or disease. The formation of the sulphate of lime is found to be more active in well manured vineyards than in those free from decaying organic matter.

Exhibit at the Fairs.

Very few persons appreciate the benefits derived from exhibitions at our industrial fairs. If you are a manufacturer you can advertise the goods manufactured in no other way so advantageously and economically as by exhibiting them at our State and County and Mechanical Fairs. At these exhibitions people see samples of your workmanship, and judge for themselves of its quality. They learn your place of business, become acquainted with you or your assistant in attendance, and when they want anything in your line they remember you as a reality—as a person who can supply their wants, and the result is, you get their order and custom.

Having been long connected with the State Agricultural Society and its fairs, at Sacramento, and with the Mechanic's Institute, and its fairs in this city, we speak whereof we know. Persons often speak to us of the benefits they have experienced by exhibiting their products at this or that fair, and we could name many cases, in point. We will give but one now which has lately been brought to our attention.

The instance we have particularly in mind is of an artist—D. H. Woods, of Sacramento. One year ago he was almost without business. He had skill and taste as an artist, but he wanted an opportunity to show the public his ability and the real merit of his work. He saw that opportunity in the State Fair, and prepared several portrait and landscape paintings and placed them on exhibition. He was successful in being awarded but three out of many premiums distributed among the artists exhibiting. But he won the attention and approval of the people, and what is more, their patronage. He received orders at the fair for a large number of portraits, and he has not seen an idle day since that time. He has now over fifteen hundred dollars worth of orders for portraits in his hands, waiting his busy brush. Mr. Woods' exhibition at the fair this year will embrace portraits of some of the best and most celebrated stock on the Pacific coast—both horses and cattle. He is said to excel as a stock artist. We have no doubt other artists who exhibited at the last fair have been equally benefitted; but we only speak of what has come under our own personal observation.

THE COCHINEAL INSECT.—The following paragraph, which we clip from the *Atlas*, has an especial interest when read in connection with the paragraph on this insect, which we give in our issue of the 6th ult.: "Mr. A. K. Vanton, at present connected with the Central Pacific Railroad, in 1869, at Lancha Plana, in this State, collected, in a short time, more than an ounce vial of the real cochineal bug on the chemizel bushes which grow on the slopes of the Mokelumne river. He says that on that occasion he took them to an apothecary's shop, compared them with the imported insect, and found them to be in all particulars and essentials the same. If this be so, it is evident that, while no great quantity is as yet been discovered, the cochineal bug is a native of this country. We have no reason to doubt, in any particular, the statement of Mr. Vanton. If cochineal could in time be added to our other exports, the prosperity of the State would be greatly promoted. The resources of California, truly, would seem to be inexhaustible.

THE SWEET WATER MINES.—Mr. J. A. McAvoy, writes from South Pass City, of the Sweet Water mines as follows: "Here is what are known as the Sweet Water Mines. A few places have been worked out, but there is a plenty of quartz here—hundreds of ledges which will pay from \$5 to \$15, and a few which will pay from \$15 to \$100 and over per ton. The Carrizo is down 200 feet and improving. The Eng. Co. are just starting to drift 600 feet for the east extension of the Carrizo, where they expect to strike it 200 feet deep.

Water Regulator for Water Closets.

It is really remarkable to witness the treatment which the water closet receives at the hands of the public. If there is a handle to be pulled or a valve to be worked, that handle is pulled, or that valve is worked, with the greatest exertion of unnecessary force and the superfluity of violence imaginable by the majority of persons. The consequence is, that the affair is out of order a large portion of the time, and, besides the expense of repairs, there is a very noticeable waste of water,—an important item in this and other cities.

Various contrivances have been devised to prevent this waste of water, which is actually enormous in large cities, and to furnish the proper amount. But such a contrivance must not be complicated, for reasons implied above. The accompanying illustration shows a device which is claimed to accomplish the object in a satisfactory manner.

In the engraving, *H* is a cylinder; *D*, a valve connecting with the working lever of the water closed; *O*, a movable piston; *B*, a passage leading to the bowl; *A, A*, are passages from the cylinder, *H*, to the

chamber in which the valve, *D*, plays. The supply of water from the proper reservoir is admitted into this last named chamber through a part not shown in the cut.

The valve, *D*, is shown at its lowest position. The water from the reservoir is entering into the upper part of *H*, and forces the piston, *O*, down the seat at *K*, whence it cannot be removed without reversing the valve, *D*, and where it is firmly held by the pressure of the water above it. On reversing the valve, the water enters the lower part, *K*, and forces up the piston, *O*, until it reaches the upper seat, where it is held as before. At each movement of *O*, the water previously in *H* is forced out into the bowl; and no more can be forced into the bowl than just this cylinder-full. The pressure with which the piston, *O*, is held against either seat, renders leakage impossible.

The cylinder has the capacity of one-half gallon which is sufficient for the purpose. The valve is so connected that at each movement of the lever of the water-closet (or pressure on the seat) the valve is depressed, discharging one cylinder-full of water, and rises again with the same effect.

Those acquainted with the subject will at once perceive the usefulness and merit of this device. Steps have been taken to secure the inventor a patent for the United States and other countries. For further information apply to J. Marquis, architect, 328 Montgomery street, or J. Newsom, architect, corner Sacramento and Kearny streets, S. F.

The Late Mr. George Peabody.

The accompanying illustration, which we take from our cotemporary, the *Literary Journal*, is an excellent likeness of the late Mr. George Peabody, whose name is familiar in the mouths of all nations as a great philanthropist.

George Peabody was born on the 18th of February, 1795, in Danvers, Massachusetts, where his boyhood was passed. He learned reading, writing and arithmetic at the district school; but beyond those he was thrown upon his own resources, and the experience gained by being first a boy in a country store, then part proprietor of the same, was of the greatest value to him in after life. In May 1812, when the British invaders came sailing up the Potomac, he enlisted in the patriot army, and served a few months as a soldier. After the war he formed a partnership with a Mr. Riggs, and spent a large part of his time traveling as "drummer" for the firm. In this

black in the South; \$300,000 for museums of American relics, at Harvard and Yale Colleges; \$50,000 for a free museum at Salem; \$25,000 to Kenyon College; \$250,000 to the State of Maryland; and \$100,000 for a "Memorial Church" to his mother. Besides these public gifts, he distributed \$2,000,000 among various members of his family. Mr. Peabody refused a baronetcy and the Grand Cross of the Bath, offered to him by Queen Victoria, but received from her a grateful letter and a miniature portrait of herself, which he deposited in the Peabody Institute at Danvers.

In March, 1867, Congress passed a special vote of thanks to Mr. Peabody for his many large gifts to the public institutions of the country.

During Mr. Peabody's visit in America he became ill, and returned to England to consult his medical adviser, Dr. Gull, and to try a residence in the south of France; but that did not prove so beneficial as expected, and he returned to London. On

THE LATE MR. GEORGE PEABODY.

way he made a large business acquaintance in Pennsylvania, New York, Maryland, Virginia and other states of the South, so that in 1815, the house was established at Baltimore, with branches, at New York and Philadelphia. In 1830 when Mr. Riggs retired, Mr. Peabody found himself at the head of one of the largest commercial houses in the country. Throughout his life he maintained a character of great integrity, discretion and public spirit, though he never courted political honors, and kept aloof from party disputes.

He retired from the American house in 1837, and established the banking house of George Peabody & Co., in Warrford Court, London, where he acquired an enviable reputation for fair dealing and liberality, devoting himself largely to philanthropy. His private charities were very numerous, and the poor of London were his warm friends; but his public benefices are probably better known to the world. Mr. Peabody, during a three years visit to his native country from 1866 to 1869, gave \$2,000,000 for the education of whites and

the 4th of November, 1869, this good man breathed his last, and on the 12th of the same month, funeral ceremonies over his remains were held in Westminster Abbey. The Queen, the Prince of Wales, the Mayor and Sheriff of London, the American Minister, and other great persons joined in the procession to do him honor. The scene within the Abbey will never be forgotten by those present, who were fully impressed with the grand solemnity of the occasion. His coffin bore the following simple inscription:

GEORGE PEABODY, Esq.

Born 18 February, 1795.

At Danvers, Massachusetts.

Died in London, 4 November, 1869.

Mr. Peabody's wish to be buried by the side of his mother at Danvers was handsomely carried out by the English government, which detailed their war-vessel, the *Monarch*, for the special purpose of conveying his remains in state across the ocean to the home of his boyhood.

How his remains were placed in the old cemetery at Danvers, and what impressive ceremonies were held there are familiar to all our readers, and the name of George Peabody can never be forgotten until the world ceases to regard philanthropy as a virtue.

Practical Science at Harvard.

Amongst the series of the newly organizing departments of practical science, the numerous special professorship in which Harvard is of late taking the lead in this country, we are pleased to notice the appointment of Charles F. Hoffman of this city to the chair of Topographical Engineering.

This speciality belongs to the Engineering and the Mining Departments alike, the students of which are to be taken in charge of practically by Mr. Hoffman, and instructed by the usual lecturers in part, of course, but more particularly with a view to imparting the actual methods and details of topographical delineation in field and in office work; and the privileges here afforded will consist largely of field operations laid out for instruction in the several kinds of work in which the topographical engineer and geologist should become expert.

A course of four years is laid out for the engineering students, both in the Civil and Mining Departments; in the first year topographical drawing, and the principles of surveying; in the third year topographical surveying and field operations in part in connection with geological excursions; and in the fourth year, plotting and the working up of the field excursions.

Here are offered opportunities such as or even better than one would have on some public exploring expedition, or geological survey, or in the office of a busy engineer in high standing, with whom, however, inconvenient preliminaries, or an unreasonable apprenticeship, with too much devotion to the particular work that he may be best paid for doing, form drawbacks to the acquisition of the practice of topographical engineering, sufficient to have thus far restricted accomplishments and versatility in that most excellent branch to the few.

Simple indeed are the principles of topographical surveying, but the practices of note taking habits, sketching and the correct delineating of a country with often such opportunities that to the unpracticed could produce no survey or results at all, are things to be imparted by hand and by word of mouth—or to be thought out with infinitely greater labor and time.

Mr. Hoffman is an old Californian, having resided here since "early times," and gained a well deserved high reputation as civil engineer and topographer; having also been connected since 1860 with the State Geological Survey in the capacity of Chief Topographer. Like other of our best practical topographers, he served originally on the U. S. military exploring expeditions, with Gen. Lander, etc. His best works are the "Bay Map" of the Geological Survey, and the "Map of Central California" now in process of publication; besides the Comstock Lode in the Sutro Tunnel Volume, Mariposa Surveys, Yosemite Maps, etc.

To young men coming from or looking to our great unsurveyed empire of the West,—of mines and mountains,—no such privileges as are to be offered in the Harvard Topographical and Geological departments have been within reach heretofore, short of a journey across the Atlantic. It is to be hoped that no narrow policy of rigid examination will be set up to prevent the merest tyro, or any person or persons of middle age having tastes of this sort but rudely developed, from tarrying in Harvard, to avail themselves of any or all of its departments of practical science.

In the same connection we notice that Mr. William H. Pettee, who graduated at Harvard College, and the mining school at Freiberg, Saxony, has also received an appointment from Harvard University, as Assistant Professor of Mining.

IMPORTANT COAL DISCOVERIES are reported on one of the islands of the coast of Alaska. The coal is said to be superior to any yet discovered on this coast, and can be delivered here at six dollars per ton. If such is the fact, the discovery is most important and opportune.

DOMESTIC ECONOMY.

Ironing Made Easy.

Good ironing of clothes is a fine art, and is acquired by patient practice, and the habit of doing all work conscientiously. In families where there are young girls, there is often much nice ironing to do, and it should never fall to the mother's charge, but should be done by those who require it, except in cases where servants are kept for that purpose; and it is always well for young ladies to know how to iron in the best manner, even when there is no necessity for their doing it. Nothing more greatly facilitates the process of ironing than to have each one who irons possess her own ironing tools, such as holders, etc. In otherwise orderly families, I have seen young ladies catch up almost anything that was conveniently near, to hold irons with; often scorching valuable articles not suitable for the purpose.

Ironing Bags.

It will be found a great convenience for each ironer to have a bag, fifteen or eighteen inches square, suitably furnished, and used only by herself. It should contain an ironing-holder, of a size and thickness to suit herself. In the ironing-bags, there should always be a thin, soft-leaved pamphlet, for rubbing the irons upon, when first removed from the fire; do not use the covers. Keep in the bag also a nice, soft cloth of a light color, to finish off the iron with, also a light tin ring for resting irons upon. A mullin-ring is just the thing. Another smaller bag within the other should contain a small, white cloth for rubbing specks from starched clothes, and a soft, fine cloth for covering bosoms and collars if desired. It saves also much time and vexation to keep a wet towel near, to wipe the hands when starching, instead of rushing across a room to wash them while doing starched clothes.

Ironing Holders.

Are very essential, and should be made and kept with care. Those stuffed with sawdust are least heating to the hand. The sawdust should be made and thinly quilted into the holder; and to be just right, there should be two thin quilted holders stitched together, and then the cover put over both. Wood being a non-conductor, in a great degree, the hand is not so injuriously affected by heat as from the old-fashioned metal-handle and a common holder. A very good way is to interlay the holder with a few thicknesses of newspaper in the middle to make it lighter, and the hand will be less heated than if it is wholly made of cloth. Each ironing-holder should have one or two covers of white cloth or light calico made to fit nicely, and should be fastened on with buttons or strings; then, when one cover becomes soiled, it can be changed, and is far preferable to having several holders.

Ironing Boards.

One should have a small ironing-board for collars, cuffs, etc., a little larger than a handkerchief, and it should be covered with cloth and flannel. To the upper corners of the board a strong string should be nailed to hang it up by, and a calico cloth should be attached to the top, like the cover of a pamphlet, large enough to fall over both sides when hanging, to keep it from dust, and should be confined closely around the board by strings. With two such boards, two can iron at the same table without interfering with each other, or they could be carried to any part of the house, and save all the time usually lost by folding and putting away ironing things of large size, as blankets and covers, which are often put away in a hurried and disorderly way, to the vexation of the next one who goes to the ironing drawer or basket.

An Invention Wanted.

I wish some woman would invent a movable wooden handle for flat-irons, which could be easily adjusted on taking an iron from the fire. Some woman, whose husband is a blacksmith, and would make her models, perhaps might succeed.

These items may seem small and insignificant; but attention to them would save much time and trouble, and render an otherwise tedious process pleasant and improving to the ironers of the family, by cultivating habits of order and regularity, and a just regard for the comfort of others. We have taken the above substantially from the *American Agriculturist*.

NEW PROCESS OF PRESERVING MEAT.—A new process of preserving meat has just been perfected by Mr. Richard Jones. It

has long been known that meat preserved in tins by the ordinary process of heating in a chloride of calcium bath for a prolonged period, and then closing the orifice is surrounded by jelly, which, with most of its juice, has been extracted from the meat, leaving a tasteless and exhausted fibre. To obviate this objection, Mr. Jones exhausts the steam by a tube connected with a vacuum chamber, the meat being thus cooked with its juices left in their natural place amongst the muscular substances; while the whole process can be effected at a lower temperature than has been heretofore used, and with less injury to the flavor and appearance of the meat. It is estimated that meat can be prepared in Australia or New Zealand, including freight of tin plates, etc., freight home, and 5 per cent. commission for selling, at 2d per lb. for 6-lb tins, and about 2½ per lb for 4-lb tins.

FARMERS' WIVES.—If I had the ability I would like to write a plea for farmer's wives. They are not slaves to fashion and etiquette, as your city ladies are (poor creatures!) and they know something about toil and care and anxiety. But notwithstanding the grandeur, and glitter, and fascination of city life, I had rather be a farmer's wife and wear out in honest toil and labor of love, and gain my bread by the sweat of my brow, than to bow down to the goddess fashion, with her ridiculous flummies, and exhaust what few brains I have in studying etiquette, gentility and style. Better to spend our strength in useful labor while the hours pass swiftly by, than to be dying with ennui as many idle fashionable people are, not knowing what to do with all their time. Preserve me from walking on the "upper crust," feeling all the time that it may break and let me through! I would rather walk on the green grass with the bluesies over my head and feel that I stand on terra firma.—*Household*.

TO REMOVE "MOTH PATCHES."—In a late *Rural New Yorker* is an inquiry from M. L. P. for means with which to remove "moth patches" from the skin; and a reply advising to drink hard cider. Now it is the misfortune of many of your readers to live in sections of the country where cider can be had only at much expense and trouble; therefore I offer another, and I believe, sure remedy. Wash the patches with a solution of common bicarbonate of soda and water several times during the day for two days, or until the patches are removed, which will usually be in forty-eight hours. After the process, wash with some nice toilet soap, and the skin will be left nice, smooth and clear of patches.—*Rural New Yorker*.

A HOUSEKEEPER'S TRIALS.—A lady in giving an account of her trials on washing day, says: "I have only two servants and so have to dress the children and mind the baby, while a pile of sewing lays waiting in the workbasket." Ah! my sister, what would you do if you had to dress the children, get the breakfast, do the washing and perhaps make cheese or churn and no servant at all?

Thousands of women in the country have to do it, day after day, and year after year. There are vegetables to gather, plums to pick, wool to spin and weave and knit, apples to pick and dry, and sometimes her help is needed to rake hay.

A GOOD HELP-MATE.—The St. Paul Press publishes a private letter from a lady in the country, which shows that she "does her own cooking and baking on a farm that grows 2,000 bushels of grain, for a large family, including the voracious harvest hands, and who, in addition to all these severe domestic toils, raises with her own hands over three hundred varieties of choice flowers, doing all the laying out, digging, raking, hoeing and manuring herself."

NOW AND THEN.—An old negro woman, in accounting for lack of discipline among youngsters, insists that it is because their mothers wear gaiters. "You see, when we wore low shoes and the chillun' wanted whippin', we took off a shoe mighty quick and giv' 'em a good spanking," but now, how's a body to get a gaiter off in time? So the chillun gits no whippin' at all now-a-days."

ALL SALTED PROVISIONS should be watched to see that they are kept under the brine; for if one piece of meat lie up it will spoil the whole barrel. If the brine looks bloody, it must be scalded and more salt added; when cold pour back.

A BUSHEL of good beets, washed and crushed, will make four or five gallons of the best vinegar.

Domestic Receipts.

COOLING DRINKS.—The presence of hot weather is creating a demand for mild and cooling drinks. We append two very good receipts for preparing such:—

A delicious and slightly aperient effervescent citrate of magnesia may be made by thoroughly mixing 3 ounces of powdered loaf sugar with 2 ounces of powdered citric acid, then add ¼ ounce of calcined magnesia, 1½ ounce of bicarbonate of soda, and 1½ ounce of tartaric acid. Pass the whole thrice through a fine sieve, and then moisten it with very strong alcohol. Granulate it by passing it through a coarse sieve, and dry on a wooden tray at a temperature of 50° C. When dry add ten drops of essential oil of lemons, and then bottle at once in clean dry bottles.

A CONVENIENT AND EXCELLENT BEER for summer may be made as follows:—Take two ounces of ground ginger; one ounce of cream of tartar; one and one-half pounds of white sugar, and two lemons cut in thin slices and seeds taken out. Pour on these ingredients three gallons of boiling water; let it stand until quite cool; then stir well into a coffee cup of brewer's yeast. In twenty-four hours it will be ready to bottle, and in thirty-six will be fit to drink, but is better in a week.

FRENCH TOAST.—(A good method of disposing of stale bread.) Beat an egg on a plate and have a little dish of milk standing by. Dip the slices of bread first in the milk, then turn them on each side in the egg, and then lay them at once in the hot pan, with a little melted butter. Fry to a nice brown and send to table hot. Eat with butter, syrup or sugar.

ORANGE CREAM.—One pint cream, yolks of three eggs, six ounces powdered sugar, one orange; mix thoroughly, heat, and stir till cold.

LEMON RICE PUDDING.—Boil one-half pint of rice in one quart of milk until very soft. Add to it, while hot, the yolks of three eggs, the grated rind of two lemons, three tablespoonsful of sugar, and a pinch of salt. If too thick, add a little cold milk—it should be a little thicker than boiled custard. Turn into a pudding dish. Beat the whites of the eggs very stiff, together with eight tablespoonsful of sugar and the juice of the lemons, and brown on top. Set on the ice and eat very cold.

Mechanical Hints.

WHITEWASH OF DIFFERENT COLORS.—Take of good unslacked lime half a bushel; slack with warm water (rain water if convenient) in a forty-five gallon barrel. Keep covered while slacking. Use just enough water to slack dry. Let the lime stand four or five hours to insure its being well slacked. If it is desirable to have a good, smooth wash, the slacked lime should be sifted through a moderately fine sieve; if to be used on barns, out-buildings, and fences, it is not material about sifting.

To the lime thus prepared, add enough water to half fill the barrel, then add two gallons of flour starch, hot; one quart of grease (to make it run smoothly); four pounds of melted rosin, hot, to make it stick. The floured starch will also have the same effect.

Some use salt in making whitewash. We would not, as salt in damp weather causes the wash to crack and scale off.

After preparing the whitewash as above, fill your harrel with water, cold or hot, and you will have a wash that will stand quite well for five years. To color dark, or slate, use lampblack; for yellow, use yellow ochre; for blue, use indigo; for different shades of color, vary to suit. If the wash gets too thick make it thin with water. The older the above whitewash becomes, the better it will be, if it is kept covered with water, and not allowed to become hard.

SHALL WE PAINT SHINGLES?—Martin E. Thompson, who is endorsed by the Farmer's Club of the American Institute as good authority says that it destroys shingle roofs to paint them, and urges people not to paint them. He says the water backs up under painted shingles, so that they rot off much sooner than if left without paint. A cheap way to preserve shingles is to soak them, before laying, in whitewash made with the lye of hard wood ashes, with a little common salt dissolved in it. Heat the solution hot, and soak thoroughly.

POLISH.—Aqua ammonia, 1 oz.; prepared chalk, ¼ of an oz., mixed, makes an excellent polish for plated ware, rings, etc. It should be used with a soft brush or buckskin.

LIFE THOUGHTS.

NOTHING renders the mind so narrow and so little as the want of social intercourse.

VIRTUE and happiness are mother and daughter.

WISE MEN make more opportunities than they find.

FALSE PRIDE is the spiked fence that shuts us out from the garden of Paradise.

HUMILITY and generous truth are the angels that open the gates for our entrance into Paradise.

A SINCERE confession of our ignorance is one of the fairest and surest testimonies of our judgment.

THE FEARFUL DOOM.—It is comparatively easy to refrain from forming habits of intemperance; but it is almost impossible to break away from them when formed.

ANY one can drift. But it takes prayer, religious principle, earnestness of purpose, and constant watching to resist the evil of this world—to struggle against the tide.

COULD we see things as God sees them, we should not have a solitary wish for a single alteration in our circumstances; we should say "It is well."

CHRISTIANS pray with outspread, but clean hands; with uncovered head, because they are not ashamed; and without the aid of a prompter, because we pray from the heart.—*Tertullian*.

EVERY parent is like a looking glass for his children to dress themselves by. Therefore, parents should take care to keep the glass bright and clear, not dull and spotted, as their good example is a rich inheritance for the rising generation.

Good Sense.

The great trouble among American youth is the lack of application and thoroughness in what they undertake. Anything that cannot be learned by superficial study is given the go-by for something less tedious and irksome. Study and hard labor are looked at from a wrong standpoint; and as a consequence the clerkship ranks are full of unemployed young men, and the professions are overflowing with mediocrity, while good mechanics find plenty of work at living prices. The evil spoken of is seriously felt. And those who work at a trade do it in so loose and careless a manner that they often are not competent to do the work they promise to do.

We are needy in every condition. We are soldiers, and we need that grace should find us both shield and sword. We are pilgrims, and we need that love should give us both a staff and a guide. We are sailing over the sea of life, and we need that the wind of the Spirit shall fill our sails and that Christ shall be our pilot. There is figure under which the Christian life can be represented in which our need is not a very conspicuous part of the image. In all aspects we are poor and needy.—*Spurgeon*.

FREBEL says:—"He who will recognize the Creator must early exercise his own creative powers; exercise them with a feeling of consciousness for the representation of the good; for works are the bond that next to faith unite the creature with the Creator; and the consciousness of doing the same is the real living union between man and God; alike in the individual or in the race. With all this education must begin, and to this end it must always tend."

CONFESS YOUR WRONGS.—If you have wronged your brother, do not persist in the wrong; let not unworthy shame restrain you; but go to him with tears of love and say: "I acted in blindness and passion. I did wrong—now I mean to do right," and if that brother is worthy, he will hut love and cherish you the more tenderly for this generous emotion.

SAVE.—What is there a man cannot save and improve? By curbing appetite and restraining passion, by observing prudence and maintaining regularity, he may save his health, husband his strength, and preserve the springs of life, as constant fountains of energy and happiness, to sustain and cherish him under every labor and hardship. Time—the indolent might make wealth of it—one of the hours wasted each day on trifles, eared and devoted to improvement, is enough to make an ignorant man wise in ten years—to brighten up and strengthen faculties perishing with rust—to make life a fruitful field, and death a harvester of glorious deeds.

Meteorological Observations.

AT SACRAMENTO, CAL., BY THOS. M. LOGAN, M. D.
Permanent Secretary of State Board of Health.

Lat. 38° 31' 41" N. Long. 121° 29' 44" W. Height above
mean low tide, at San Francisco, 74 feet. Height of lower
surface of mercury, 94 feet. The amount of cloudiness is
designated by figures, 0 being entire clearness; 5, half
cloudiness; 10, entire clearness; and intermediate numbers
in proportion. The force of the wind is also registered in
the same manner; 0 being a calm, 1 a very light breeze,
and 10 a hurricane. The means are derived from three daily
readings at 7 A. M., 2 P. M., and 9 P. M., in uniformity with
the arrangements of the Smithsonian Institute.

*Thermograph. +Rain.

REMARKS.—The above table contains the record of the
first "heated term" of the season. Coming suddenly
upon us, immediately after the late rains and the at-
tendant cool weather, its effects were more sensibly felt
and complained of than if our systems had been gradu-
ally prepared for the change. It will be seen that the
maximum, 98°, was reached on Friday, 9th. This,
however, was the reading of the Thermograph in
comparatively cool location; for in many localities the
mercury run up to 100°, and even 104°, in the shade.
Such intensely hot weather so early in June is unprece-
dented. Fortunately it never lasts long, and at the
present writing (10th), as shown by our table, we have
passed from a tropical to a temperate region, and are
now basking in the cool, invigorating, oceanic wind,
which, pouring through the Golden Gate from the west,
is deflected by the Contra Costa mountains, and reaches
us in this portion of the valley as a southeast wind.

San Francisco Metal Market.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

Good work at high prices if desired. 23v1-12m-bp

WIESTER & CO.,
No. 17 New Montgomery Street (Grand Hotel), San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Patent Sand-Caps for Hubs of Vehicles.

The invention consists of a ring of metal which is made
conical in form and has its smaller end attached to the axle
near the collar. The edge of the larger end projects into a
groove, which is formed in the inner end of the hub, and
thus effectually protects the collar and the axle-box from
sand and dust. In the illustration, A is the hub of the
wheel, B the axle, which may be fitted in any of the ordi-
nary ways, C the collar, and D a ring of wood or metal,
which may be put on by removing C. In the case of axles
already made, or in new work, the ring may be slipped on before the axle is welded up. Town, County, Shop and
State Rights for Sale.

A New Patent Atmospheric Attachment to Dental Plates.

Can be applied to both New and Old Plates, so as to retain them firmly in the mouth while eating or talking;
superior to any thing ever before invented, cost of applying it small, and the greatest improvement immediately
felt by the wearer.

All who have badly-fitting plates can, by the application of this Attachment, wear them with perfect comfort
and usefulness while eating, talking, etc. State, County and Office Rights for Sale.

Hill's Grate Bar.

This Bar will withstand 800 degrees more heat than any other Bar now in use. It is unequalled in durability.
It generates more steam from the same quantity of coal, making a saving of from 1 to 15 per cent. in fuel. It has
been examined and used by some of the most scientific Engineers in the United States; and pronounced the best
Grate Bar extant for marine or land boilers. The Patent Right to the Pacific Coast is placed in our hands for sale.
A complete model can be seen at our office, or a descriptive circular will be sent on application.

A New Potato Digger.

County Rights for Sale and one Digger free.

A New Patent Stencil Plate that will Mark any Name or Number.

A Complete Self-acting Nut Roaster.

The Best Horse Hay Rake ever invented. County Rights for Sale.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas
Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full
particulars sent on application.

CALIFORNIA CHEMICAL PAINT COMPANY,
MANUFACTURERS OF

AVERILL'S CHEMICAL PAINT, OF THE
Purest White, and 100 Different Shades,
MIXED READY FOR APPLICATION.

This is the ONLY PAINT OF COMMERCE manufactured, being always held in solution by its peculiar
chemical combination, and sold by the gallon. It is warranted not to peel, crack, nor chalk off; has a greater
body and covering property, and will last twice as long as the best of other Paints, with a fine, hard, glossy sur-
face, impervious to the atmosphere, and extremely durable.

Office, 408 California Street.

THE GIANT POWDER COMPANY

Are now manufacturing besides the famous regular

GIANT POWDER, A NO. 2 GIANT POWDER,
Somewhat slower in its Explosion, which we recommend for
BLANK BLASTING, COAL MINES,
AND FOR ALL SUCH WORK WHERE THE ROCK IS NOT VERY HARD.
It is fully as safe as the other and evolves neither smoke nor noxious fumes when exploded.

Price. 50 Cents per Pound.

The sales of both grades increase very fast, which is the best proof of their superiority over other explosives.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market. We
have been awarded successfully

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.

We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives
now in use, and the lifting force of the BEST BLASTING
POWDER, thus making it vastly superior to any other
compound now in use.

A circular containing a full description of this Pow-
der can be obtained on application to our Office.

PAIN KILLER
PROPR.
PERRY DAVIS & SON, PROVIDENCE, R.I.

1840 1870

The "PAIN KILLER" may justly be styled the great medi-
cine of the world, for there is no region of the globe into
which it has not found its way, and been largely used and
highly prized. Moreover, there is no climate to which it has
not proved to be well adapted for the cure of a considerable
variety of diseases; it is a speedy and safe remedy for burns,
scalds, cuts, bruises, wounds and various other injuries, as
well as for dysentery, diarrhea, and bowel complaints gen-
erally, it is admirably suited for every race of men in the
face of the globe.

It is a very significant fact, that notwithstanding the long
period of years that the "Pain Killer" has been before the
world, it has never lost one whit of its popularity, but on the
contrary, the call for it has steadily increased from its first
discovery, and at no previous time has the demand for it
been so great, or the quantity made has been so large, as it is
to-day.

Another significant fact, that nowhere has the Pain
Killer ever been in higher repute, or been more generally
used by families and individuals, than it has been here at
home, where it was first discovered and introduced. That
the Pain Killer will continue to be, what we have styled it,
THE GREAT MEDICINE OF THE WORLD, there cannot be the
shadow of a doubt. Providence Advertiser.

Of a far Higher Class than any other proprietary
medicine of the day stands

Tarrant's Effervescent Seltzer Aperient,
And for this reason: it is an exact counterpart of one of
the most valuable medicines in the world. We refer to
the great Seltzer Spring of Germany, to which thousands
of the dyspeptic, the bilious, the rheumatic, and the
victims of venal diseases resort annually, and return to
their homes convalescent or cured. The Aperient is
one of the first, and by far the most successful, of all
the efforts made to reproduce, in a portable form, the
popular mineral waters of Europe. SEE THAT YOU
PURCHASE ONLY THE GENUINE ARTICLE.
SOLD BY ALL DRUGGISTS.

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good
Sauce. The success of
this most delicious and
unrivalled Condiment
having caused certain
dealers to apply the
name "Worcestershire Sauce" to their
own inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and labels
of which the names of Lea and Perrins have been
forged, L. and P. give notice that they have
furnished their correspondents with power of attorney to take
instant proceedings against manufacturers and vendors of
such, or any other imitations by which their right may
be infringed.
Ask for LEA & PERRINS' Sauce and see name on
wrapper, label, bottle and stopper.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the
Scientific Press, we are obliged to go to press on Thursday evening—
which is the very latest hour we can receive advertisements.

Altona Gravel Mining Company—Location

of Works, Grass Valley, Nevada County, California.
Notice is hereby given, that at a meeting of the Board
of Trustees of said company, held on the twenty-third day of
May, 1871, an assessment (No. 2) of twenty-five cents per
share was levied upon the capital stock of said company,
payable immediately, in United States gold and silver coin,
to the Secretary, at the office of the Company, No. 29 Mer-
chants' Exchange, San Francisco.

Any stock upon which said assessment shall remain un-
paid on Monday, the twenty-sixth day of June, 1871, will be
deemed delinquent, and will be duly advertised for sale at
public auction, and unless payment shall be made before, will
be sold on Monday, the seventh day of July, 1871,
to pay the delinquent assessment thereon, together with
costs of advertising and expenses of sale. By order of the
Board of Trustees, DAVID WILDER, Secretary.

Office, No. 29 Merchants' Exchange, California street, San Francisco, Cal. 21v22-1m

Altona Number One Gravel Mining Com-

pany, Alta Hill, Grass Valley, Cal.
The first annual meeting of the stockholders in the
above named company will be held at their office, No.
29 Merchants' Exchange, San Francisco, on Thursday,
July 6th, 1871, at 2 o'clock p. m., for the election of
Trustees, and the transaction of other business. By or-
der of the President, DAVID WILDER, Secretary.

jun3-5w

Eagle Quicksilver Mining Company—Lo-

cation of Works, Santa Barbara County, California.
Notice is hereby given, that at a meeting of the Board
of Trustees of said company, held on the 14th day
of June, 1871, an assessment of Twenty dollars per share
was levied upon the capital stock of said company, payable
immediately in gold coin of the United States, to the Secretary
at his office, Room No. 5, No. 302 Montgomery street, San
Francisco, California.

Any share upon which said assessment shall remain un-
paid on Wednesday, the 9th day of August, 1871, shall be
deemed delinquent, and will be duly advertised August
12th, 1871, for sale at public auction, and unless payment
shall be made before, will be sold on Monday, the 14th day
of August, 1871, to pay the delinquent assessment, together
with costs of advertising and expenses of sale. By order of the
Board of Trustees, WM. H. WATSON, Secretary.

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation.

For further particulars address

FURMAN E. WILSON.

San Francisco,

MILLER'S TRUSSED PLATFORMS,
COMPRESSION BUFFERS AND AUTOMATIC COUPLERS, FOR RAILROAD CARS.

PATENTED MARCH 31, 1863, JANUARY 31, 1865, AND JULY 24, 1866.

Office—No. 231 Broadway, Rooms 4 and 5, opposite City Hall Park, New York.

The advantages gained by the use of these improvements may be briefly stated as follows:

1st. The platforms are held in a plane with the sills on the cars.

2d. The platforms cannot be broken by any ordinary accident.

3d. Telescoping is impossible.

4th. Any required compression may be attained, to prevent accidents by oscillation.

5th. No links and Pins are required, and no one is required to go between cars to couple them.

6th. The platforms may be held as close together as desired.

7th. By close coupling the train is shortened.

8th. They will not accidentally uncouple.

9th. They may be uncoupled "without shutting off," to make a flying switch.

10th. They are strong; the train will not "break in two" at starting or while running.

11th. They cause the train to move steadily and not jerk in starting or stopping.

12th. They work well at great variations of height.

13th. They will couple with all kinds of "drawheads" and "couplers."

14th. They are cheap and durable.

15th. Injury to men when coupling cars is entirely prevented.

16th. Injury to persons by falling between cars is entirely prevented.

17th. Injury to persons and to cars by "telescoping" is entirely prevented.

18th. Injury to persons and to cars by "oscillation" is entirely prevented.

19th. The great steadiness of the cars, produced by compression, renders sleeping cars much more desirable.

20th. "Train Brakes" are rendered more valuable by the non-existence of "slack" in the train.

No Railroad Manager who comprehends the case fails to give these improvements a "trial," and all those who have tried them have adopted them.

Prices of Materials, Etc.

Coupling Hooks.....	\$24 50 each.
Buffers.....	11 00 each.
Levers.....	2 00 each.

Patterns in Full Sets, or Single Pieces, for all castings used in the Improvements; and Templets, for Wrought Irons, AT COST. Drawings, Tracings, and superintendence of work are not charged for.

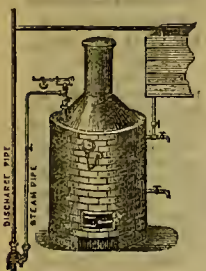

These articles will be promptly furnished and shipped to any part of the country on short notice. Orders must state what routes the goods are to go, and whether by express or as ordinary freight.

23v22tf

E. MILLER.

STEAM JET PUMP.

Blakelock & Williams' Patent.—For Water, Oils, Acids, Etc.

The best COLD WATER pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit:—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Send for Circular. PARKER & HUNT, Southeast cor. Tenib & K Streets, Sacramento City Cal.

AGENTS—CHAS. F. BROCK, 117 California St., San Francisco; KEPP & BARON, Stockton. Can be seen at McAFFEE, SPIERS & CO'S. Boiler Works, E. F. 21v21-1f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

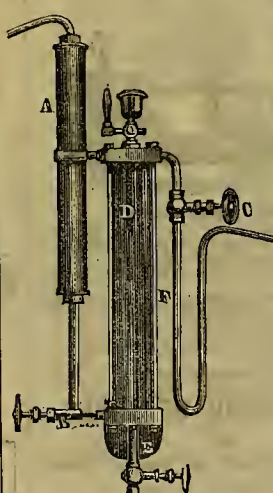

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION.—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted siphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before re-charging the same. K, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the siphon of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C. fel8-1f

G. W. STRONG & CO., Metallurgical Works, No. 10 Stevenson Street, near First, SAN FRANCISCO.

We purchase Ores, Bullion, etc. Ores worked and Tests made with care. Also, Assays of Gold, Silver, Copper, Lead, Tin and other Metals. 23v22tf

F. MORRIS, Practical Assayer and Metallurgist, Nos. 30 and 36 Fremont street, SAN FRANCISCO.

Having rented Amalgamating Works from Union Foundry, is prepared to work Ore of all kinds by Pan Amalgamation, Chlorination, or Smelting—guaranteeing to work as close to the fire assay as any one on the coast. 19v22-3m

The Patent Wood Horse Collar AND HAME COMBINED

Is the Best, Most Convenient and Durable Collar ever used. Will last ten times as long as the Leather Collar. Always keeps its place and shape. No stitches to burst, or stuffing to press out. Wood, being cool, never SWEATS or GALLS the animal. Keeps the Neck and Shoulders free from Sores in the hottest of weather.

Warranted to Cure Horses with the Sorest Shoulders In Three Weeks, Working Every Day.

For further particulars as to price of Collars, etc apply to or address WELDMAN & MARBLE, No. 30 California Street, San Francisco, Proprietors for the Pacific Coast.

Agents Wanted. 19v22-2m

Eighth Industrial Exhibition,
UNDER THE AUSPICES OF
THE MECHANICS' INSTITUTE,
San Francisco.

WILL OPEN
Tuesday, August 10, 1871.

And continue for four weeks, in the Pavilion
of the Society, on Union Square, in
the city of San Francisco.

APPLICATION FOR SPACE can be made at the Library of
the Mechanics' Institute any day, between the hours of
1 and 9 P. M., or by letter to the Corresponding Secre-
tary, H. C. KIRNE.
Mr. J. H. GILLMORE is authorized to visit those who
intend to exhibit from this city. feb18-18p-tf

Hubbard, Lippincott, Bakewell & Co.,
MANUFACTURERS.

J. E. Emerson's New Patent Flange Toothed Circular
Saws, are superceding all others.
Groshy's Patent Gang Saw Buckle; Lippincott &
Twiss's Patent Cross Cut Saws; Davis' Patent Double
Cut Gang Saws (cuts both ways); and all of the cele-
brated brands of SAWS formerly manufactured by both
HUBBARD, LIPPINCOTT & CO. and LIPPINCOTT & CO.
Also, SHOVELS, AXES AND SPADES.
All orders from the Pacific Coast will receive special
attention and be forwarded with dispatch.
Our extensive facilities enable us to furnish our Goods
at the
Lowest Market Prices,
And all Warranted of SUPERIOR QUALITY.
For Descriptive Catalogue and Price Lists address

BOONE'S C-SPRING ROLLER SKATE.
PATENT GRANTED.

This SKATE surpasses in Elasticity, Durability and Ease of Operation, any other Skate in existence. Its
superiority has been proved wherever it has come in competition with any other Roller Skate.
FOR DESCRIPTION SEND FOR DESCRIPTIVE CIRCULAR.
Warranted to run longer without requiring to be repaired than any other Skate.
Owners of Rinks will find it the most profitable as well as the most satisfactory to their patrons. The
patentees guarantee the right to run this Skate to purchasers of rights for the full term of the patent, and
Warrant it to be no Infringement on any Existing Patent.
State, County, Town and Rink Rights for sale at reasonable terms.
Apply by letter or in person to

VOLUME XXII.
Number 25.

The Niagara Direct-Acting Steam Pump.

An inspection of this pump, and a comparison with others of the same class, shows that the Niagara is very simple in construction, being cast as far as possible (without detracting from its simplicity) in separate parts, so that any one portion may be easily replaced in case of accident.

Another point, of great importance in all steam pumps, is the ease of access to the water-valves in this device. Only one nut need be unscrewed in order to remove the bonnet from the valve chest; and this having been done, the valves are fully exposed and may be quickly removed and cleansed and the parts cleared of any obstruction which may have entered through the suction valves. Then the bonnet can be replaced, the whole operation being done in an exceedingly short space of time. These water valves have four square faces; should they become worn on one side, they may be turned, and this can be done until all the four faces have been used. Any carpenter can make, in a few moments, of some hard wood, a set of valves for this pump should the original ones wear out. The metal valves may be faced with leather for mining purposes, or vulcanized rubber valves will be furnished if required.

The direct-acting pump of this make is provided with a patent steam valve, by virtue of which the pump will start, when at any point of the stroke, on letting on steam. Hence the pump cannot become set on the center, and, moreover, can be run at any rate of speed. Thus, when feeding the boiler, it can be made to run as fast or as slow as may be desired; indeed, it can be run so slow, without fear of stopping, that the motion is hardly perceptible.

The pump is claimed to be particularly well adapted for mining purposes, for should it become submerged in the mine, it will start on turning on steam from the boiler at the top of the shaft, and work notwithstanding the condensation of steam incident to carrying it that distance to the pump. It has been proved in this respect in the mines of Colorado and Pennsylvania, when from fifteen to forty feet under water. Another advantage is that both the steam and the water cylinders are fitted with metallic ring packing (or hemp may be used if preferred), so that they are equally adapted to pumping either hot or cold liquids. Their value in this respect is attested by their general and satisfactory usage in breweries, distilleries, sugar houses, oil refineries, etc.

In adapting these pumps to the various duties of transferring and forcing the different liquids, a large number of patterns have been accumulated, so that the manufacturer holds himself ready to meet any

want which may be manifested in this line. For all special cases, or for forcing liquids to an unusual height, the proportion of the steam cylinder to the water cylinder will be varied to suit the requirements of the case.

The inventor of the Niagara pump, Mr. Charles B. Hardick, has taken out patents in the United States, England, France and Belgium. The device is manufactured in this country only at his Niagara Steam Pump Works, 23 Adams street, Brooklyn, New York. His pumps, it should be added, were awarded the First Premium at the American Institute Fair, at New York, in 1867, after a severe competitive test, with other pumps on exhibition.

There is also built, at the works named, a steam crank pump and engine combined, which is adapted to driving machinery,

Academy of Sciences.

The regular meeting of the Academy was held last Monday evening. To fill the vacancy occasioned by the resignation of Mr. Carlton, Mr. A. D. Hodges, Jr., of the SCIENTIFIC PRESS, was elected Secretary.

Prof. Davidson presented a collection of plants from Alaska, collected, in the vicinity of Sitka Sound, by Rev. J. O. Raynor, Chaplain U. S. Army. Various pamphlets had been received since the last meeting. A communication was received from the authorities of the Odd Fellows' Library, tendering to the members of the Academy the freedom of the Library. A vote of thanks was returned, with the corresponding privilege of the freedom of the Academy rooms to the officers of the Library. Such interchange of courtesies are

and female flowers were usually separate, and so rare was it that they were intermingled on the same stem, that a prominent botanist lately asked the question through the *American Naturalist*, if such a thing had ever been seen. This was a case in which it existed.

Dr. Gibbons presented two plants which he had found growing in a boiling spring in Pueblo Valley, Nevada, 100 miles north of Winnomneca, the water of which was at least at 140 degrees.

Invention—Earthquakes.

Prof. Davidson, of the Coast Survey, showed and described an instrument on which he had made several valuable improvements. By the combinations made by the Professor, and the construction, both latitude and longitude can be determined by one instrument with great ease and accuracy. This combination instrument has been adopted by the corps of Topographical Engineers, and the engineers of Europe are taking pattern from it. The two old-style separate instruments necessary for the purpose cost \$2,100. This device costs \$1,200.

Dr. Gibbons said he had several times made reference in the Academy to pendulum movements of the thermometer, which he had attributed to slight earthquake motion, but the members thought what he saw was but the effect of the wind. He had since noticed several times the same phenomenon. On the 9th and 10th of April last, he noted several distinct variations, and on the 11th, according to the papers, there was a terrible earthquake in China, killing 2,800 people and overthrowing buildings. His theory of earthquakes was that some of them were caused by the gases of the earth passing from one sub-surface cave to another. It was but natural to suppose that just prior to an earthquake the pent up gases should render the crust of the earth in a state of tension in various points. He had no doubt that his observations of the barometrical motion were the result of earthquake movements.

Professor Davidson mentioned a peculiar wave-like ripple which he noted in San Diego Bay, May 26th, at 7.10 A. M., and which he thought could not possibly have proceeded from a breeze.

Obituary.

Dr. Gibbons was appointed a Committee to draw up resolutions of respect for the late Gregory Yale, formerly a member.

Dr. Cooper called the attention of the Academy to the death of Capt. Blanchard, of Washington Territory.

HON. W. D. Kelly lectured before the bankers and merchants of Philadelphia, June 12th, on the development of the northwest by the North Pacific Railroad, and the effects of the same upon the trade and commerce of the Middle States.

NIAGARA DIRECT ACTING STEAM PUMP.

and is claimed to possess all the advantages of the device above described. An important feature in it is that the pump can be detached from the engine in less than a minute, and all the steam employed in driving machines, when it is not necessary to use the pump.

RETURNED.—Mr. Dewey, of this office, has just returned from his trip to the Eastern States. His visit to Washington, New York and other Eastern cities has resulted in beneficial transactions of much importance for the progress of our newspaper and other business interests.

very pleasant to see, and none too frequent.

Curiosities of Vegetation.

Dr. Gibbons presented a bunch of seaweed, from near Half Moon Bay, and the coast in that vicinity. It was of fibrous structure, and had been utilized by the natives along the coast in making ropes. It was found near the edge of the ocean, in the barren sands. Where one of these plants grows a cone of sand accumulates around it. Mr. Bloomer thought it was the *Transeria Chamisoni*.

Dr. Cooper presented a cluster of flowers of Indian corn, which he said was a curiosity. It was well known that the male

MECHANICAL PROGRESS.

ATMOSPHERIC GAS ENGINE.—The *Mechanics' Magazine* for May 26th, describes a new engine patented by Messrs. Lange and Otto, of Cologne. We quote part of the description:—"Gas and air, mixed in such proportions as to give an explosive compound, are admitted under a piston which slides air-tight in a vertical cylinder open at the top. The compound is ignited, explodes, and the explosion drives the piston upwards. The ignited gases having increased in volume, lose their heat, their pressure becomes less as the piston rises, and when it has got to the top of the cylinder a partial vacuum is formed and the pressure of the atmosphere makes the piston descend. * * * The piston, instead of having a piston rod connected to the fly-wheel shaft by a crank and connecting rod, has a rod fixed to it upon which is formed a rack in gear with a spur wheel upon the fly-wheel shaft; this spur wheel is not fixed to the shaft, but is so connected to it by means of a ratchet wheel or friction clutch mechanism that when made to revolve by the rising of the piston and its rack, it turns freely upon the shaft, but when made to turn in the reverse direction by the downward motion of the piston and rack it causes the shaft to revolve with it. Thus when the ignition of the mixture of gas and air takes place beneath the piston the expansive force of the heated gaseous products of combustion causes the piston to be thrown rapidly up to the top of the cylinder, no other work being at the time performed by such motion than the turning of the spur wheel loose upon the fly-wheel shaft. By the time that the piston has arrived at the end of its stroke the expansion of the gases has cooled them to such an extent that by their consequent condensation a partial vacuum has been formed beneath the piston, the latter portion of the stroke of which has been made by the momentum which it has acquired, and the pressure of the atmosphere now consequently forces down the piston and rack, thereby causing the fly-wheel shaft to revolve as described."

IRON WORKS IN MISSOURI.—The Vulcan Iron Works will this season erect a furnace larger than any now in use in the United States. "The new furnace will stand on twelve columns, each thirteen feet high—will be twenty-five feet interior diameter, or bosh, and one hundred feet high. It will have five times the cubical area of any furnace now in Carondelet. Her hot-blast will be entirely of fire-brick, encased in wrought iron, and therefore almost indestructible. The temperature of heat thus gained will range from fourteen hundred to sixteen hundred degrees, and higher, if desired; whereas the heat of furnaces at present, in cast iron pipes, cannot in safety exceed 850 degrees. This furnace is expected to produce from 180 to 200 tons of iron per day."

The *Iron Age* says of the Vulcan Works: "The length of the puddling mill is 468 ft., by a width of 83 ft.—being the largest rolling mill west of the Alleghanies, and having twenty double puddling furnaces, equal to forty single ones. The rail rolling mill is in the western building. The pig metal from the blast furnaces goes immediately to "a mill," where it is decarbonized and converted to wrought iron. After thus going through different manipulations, the bar is transferred to the western division, or rail mill, where the piled mass is put into heating furnaces, raised to a white heat, and then put in the train of rollers, three in height, and is at once rolled into the finished rail before cooling. This mill, when in full operation night and day, has a capacity of making 40,000 tons per annum of finished rails."

PNEUMATIC HOTEL TELEGRAPH.—The *Manufacturer and Builder* for June thus describes it: "The compression of an ordinary India rubber bulb at one end of a pipe transmits an impulse or wave through the column of air therein contained. At the other end of the tube is a box with an elastic membrane covering it, on which lies the end of a lever which works the bell-hammer with the same movement as that in which the key of a piano-forte transmits motion to the hammer which strikes the string. The impulse passing through the tube expands the membrane, which raises the lever and so strikes the bell. For many reasons, lead tube has been found preferable to any other material, to use as a means of transmitting the impulse. The tube itself being drawn, the interior surface is very smooth and presents no inequalities to re-

tard the velocity of the wave. The metal is ductile and entirely inelastic, so that none of the force of the impulse is lost by its expansion. This apparatus has many advantages over the ordinary electric telegraph now in use for hotel annunciators and other purposes in large buildings. The principal ones are its cheapness and the facility with which it can be kept in order; the expense of substituting small lead tubing for copper wire being amply balanced by the amount gained by doing away with the troublesome and expensive electro-magnetic apparatus and batteries, which, if not in perfect order or in the least neglected, render the whole system to which they are attached useless."

BITUMINOUS COAL THE MOST ECONOMICAL.—The *Philadelphia Ledger* says that the Superintendent of the United States Armory at Springfield, Massachusetts, has been conducting a series of experiments to test the value of certain kinds of coal as a steam generator. Each variety of three different classes of coal was used for six consecutive days in raising the steam for the engine of the establishment, with the following reported results: Of the Lackawanna, or hard anthracite, 4.01 pounds per horse power were used per hour; of the Pittston, a softer anthracite, 4.02 pounds were used; and of the Cumberland, or bituminous coal, of Maryland, 3.03 pounds were used. At the Springfield Armory, the Lackawanna coal cost \$8.50 per gross ton, the Pittston \$7.85, and the Cumberland \$9.10. From these data it is calculated that the cost, per horse power, is 15 mills for Lackawanna, 14 mills for Pittston, and 12 mills for Cumberland—and it is therefore alleged that bituminous coal is the more economical fuel as a steam generator, making more heat and creating more power per pound and per cent. of cost than the harder coals.

SCREW VS. PADDLE.—The *London Times* says that the steamer *Syria*, built in 1863, and fitted with paddle-wheel engines of 450-horse power, attained a speed of 13.038 knots per hour, and the consumption of coal was at the rate of 45 tons per day. She has recently been converted into a screw-propeller, without any change in the model beyond that made by the removal of the wheels and wheel houses. The crank engines were taken out, and in their place were substituted compound inverted engines of 300 nominal horse-power. These engines have two cylinders, of 72 and 36 inches respective diameter, with a stroke of 4 ft. 2 in. On her trial trip as a propeller the *Syria* attained a speed of 12.637 knots an hour, with a consumption of coal not exceeding 18 tons per day; thus showing that while the speed is decreased only 0.421 knots an hour, with 150-horse power less than before, there is a saving in coal of 27 tons per day. Moreover, she has now storage room for 1,200 tons of cargo, against 500 tons—her former limit.

TWO-KEYED TELEGRAPH INSTRUMENT.—We take the following from the *Mechanics' Magazine* for May 26th: "A new instrument has been brought out by Mr. Herring. It is furnished with two keys, one to work a lever carrying a pin, to make a dot, and the other to work a lever carrying a small linear stile to make a dash. Greater accuracy seems likely to be secured; for it now takes a very long time to acquire the art of releasing or holding down the key with accuracy. It will be much easier to learn to use two keys, one for the dot and the other for the dash, and to use them with the same rapidity. Mr. Herring suggests that it would be practicable to emboss two clips at the same operation, and to give one to the sender, who would thus know with certainty what message had been despatched."

CARTRIDGE MANUFACTURE.—A single firm in Springfield, Mass., turn out 150,000 patent metallic cartridges per day. "These are in seventeen sizes, and are of the most perfect finish. The firm consume over 100 tons of lead per year, beside a large quantity of copper. Their machinery, much of which was invented by themselves, is all new, and of the highest efficiency. They are about to put in a 40-horse power engine, and add to their working force."

WIRE ROPE.—The largest rope in the world has been recently manufactured at Birmingham, England. It is 11,000 yards in length, 5½ inches in circumference, and weighs over 60 tons. The rope consists of six strands of patent charcoal wire laid round a hemp center. Each strand contains 10 wires; each wire measures 12,160 yards, so that the entire length of the wire reaches the total of more than 412 miles.—*Iron Age*.

SCIENTIFIC PROGRESS.

PHYSICAL CONSTITUTION OF THE SUN.—In *Silliman's Journal* for June, Prof. W. A. Norton has an article upon this subject, in which he takes the ground that the heat repulsion emanating from the sun causes the various substances which it is composed of, probably the same which are present in all cosmical bodies,—to arrange themselves in successive envelops according to the gravity of the atoms constituting each; beginning with the heavier metallic vapors, and terminating with the lighter (potassium, sodium, etc.), and the permanent gases, with hydrogen outermost. The waves of radiant heat, which pass from atom to atom, directly urge the atoms away from each other by repulsive impulses. Certain phenomena relating to comets suggest this theory, and thereby explain some of the solar phenomena which have been obscure. We quote:—"If, as is now conceded by astronomers, the tail of a comet is made up of matter detached from the general mass of the comet, by reason of a repulsive action exerted by the sun, it must also be admitted that the matter expelled is not all urged away by the same intensity of force, and with the same velocity; for we find that it is much more widely dispersed in the plane of the cometary orbit than is consistent with this supposition. * * * There would seem then to be no alternative but to admit that the tail of Donati's comet was composed of different substances, (or else of one substance in different physical states) subject to a repulsive action from the sun of various degrees of intensity; and either prevailing over the sun's attraction of gravitation, or partially counteracting it, and so giving rise to an effective repulsion for certain of these substances, and to a diminished gravitation for others. The simplest theoretical explanation that can be given of this state of things is to suppose that the solar repulsion consists of a series of impulses propagated in waves through the ether of space, and taking effect upon atoms of different sizes with varying intensity. It is obvious that if this be true, the smaller the atom the more effective should be the repulsion as compared with the gravitating force soliciting the atom; since the ratio of the two forces should be proportional to the surface divided by the volume, or that all atoms have the same density. We are thus incidentally led to infer that the larger comets consist of a variety of substances, like the earth. The question now arises what can be the origin of the force of solar repulsion. There is another side of the diversified picture presented by cometary transformations under the sun's influence, which gives some intimations on this point. Not only is a certain portion of the cometary matter repelled by the sun, but is also repelled by the nucleus of the comet. We see in large comets, a series of envelopes rise at intervals from the nucleus, on the side turned toward the sun, and recede at a nearly uniform rate until they become dissipated by the sun's repulsion. Luminous jets also stream out at times from the same side of the nucleus. These phenomena, it can hardly be doubted, are in some way the effect of the sun's heat. The simplest and most probable conclusion is that the ejecting force which is brought into play by the sun's heat is the direct repulsive energy of the heat received by the comet. We are thus led to infer that the repulsive action exerted by the sun upon matter in the state of the cometary vapors, probably consists, either wholly or partially, in repulsive impulses propagated in the heat waves proceeding from the sun."

QUANTITY DETERMINED BY THE SPECTROSCOPE.—We find the following in the *Journal of the Franklin Institute* for June: "The use of the spectroscopic to detect minute traces of substances has been the most glorious achievement of the chemistry of the last decade; perhaps its employment to determine minute quantities may be the great exploit of the next. As an essay in this direction, may be noticed the interesting contrivance of K. Vierordt, who divides the movable plate of the slit of the spectroscopic into an upper and lower half. Each half is provided with a micrometer screw, by which the width of the corresponding slit can be accurately measured. If the upper and lower slit are of the same width, the two spectra are of equal strength. If, however, a transpar-

ent colored medium be brought before the upper slit, for example, a tinted glass, a thin plate of any colored body, or a solution of a colored substance in a tank with parallel sides, we have two spectra of different intensities. The other slit is now diminished by the motion of the micrometer screw until the spectra are made equal in strength, and by comparison the amount of this motion is made to give the amount of coloring matter present."

PROF. WYVILLE THOMSON ON "LIFE."—*Nature* for May 25th, gives the first part of Prof. Thomson's late introductory lecture at Edinburgh University. Following is an extract:—"Life has been called the vital force, and it has been suggested that it may be found to belong to the same category as the convertible forces heat and light. Life, seems, however, to be more a property of matter in a certain state of combination than a force. It does no work in the ordinary sense. If a man lift a weight off the ground, many of the so-called vital actions are called into play, but yet every part of the work done can be accounted for by the action of the ordinary physical forces. The act of the will, which induced the lifting of the weight, can be referred, we can scarcely doubt, to the mechanical action of some part of a large and complicated apparatus, the cerebral hemispheres, and was accompanied by a waste of its substance. * * * Chemical forces act in living beings under very special circumstances. For a series of years a mass of substances are held undergoing constant change and throughout in the most unstable state of chemical combination. The instant the condition of life is removed, decomposition commences, and the complex constituents of the body are resolved into more simple and stable combinations. But yet it may be fairly questioned whether the chemical relations of the component elements of an organized body are in any way directly affected or controlled by life. It has become quite conceivable, especially through the researches of the late Master of the Mint, that a constant adjustment and re-adjustment of membranous and colloid diaphragms in the presence of powerful catalytic agents may possibly explain the maintenance of almost any chemical conditions however complicated. The one function of living beings whose explanation it seems at present impossible to imagine except by regarding it as the manifestation of a special property, is what has been called the 'moulding of specific form;' the building up of a heterogeneous and complicated organism, which shall repeat, not rigidly but with a certain flexibility, the characters which have been transmitted to it through a germ from a parent, every molecule of every part having thus a direct relation in form, in position, and in composition, to every other molecule of the body. At present, regarding it from a purely material point of view, we are scarcely justified in regarding life as more than that condition of an organized being in which the products of chemical and physical changes taking place within it are stamped with a specific organic form."

THE OPAL UNDER THE MICROSCOPE.—At a late sitting of the Imperial Academy of Sciences in Vienna, Prof. von Hochstetter communicated some microscopic investigations on opals, by Dr. H. Behrens, in which the author states that most opals are mixtures of various minerals, including a colourless fundamental mass, containing (microscopically discoverable) hydrophane, caccholong, quartz, hydrated and anhydrous oxide of iron, ferriferous silicates, metallic sulphurets and carbonates, and organic substances:—fire-opal, glass-opal, noble-opal, and hyaline are free from admixture, and the first two are structureless. The colours of the noble-opal are interference-colours, caused by their lamellae, which, however, are not tabular crystals. The double refraction discovered by Schultze in hyaline is caused by differences of elasticity such as occur in dextrin, amher, and compressed glass. The author also noticed the spheroidal structure which frequently occurs in opals.

SPONGY IRON A DEODORIZER.—It is found, says the *Mechanics' Magazine*, that iron prepared in a spongy state, by calcining finely divided iron with charcoal, is a superior deodorizer to animal charcoal. Sewage water passed through a filter of spongy iron is completely purified, and the water retains its sweetness for a considerable time. A spongy iron filter renders water beautifully transparent and apparently free from organic matter.

CORRESPONDENCE.

Lower California and the San Diego Mines.

ENS. PRESS:—Having just returned from Lower California where I have been for some weeks past, looking at the country and examining mines, having gone about

200 Miles Down the Coast

From San Diego, I availed myself of the kind invitation of the Rev. Father Ubach, (the Catholic priest of old San Diego), to ride with him in his buggy behind his two large fine horses; as it was at the time his parish duties required him to visit "San Rafael" and Sauto Tomas, to give the isolated inhabitants of that desolate country the benefit of religious services and teachings; it being made obligatory for him to make the trip and bold services there twice a year. This is done without any appropriation of funds for the extraordinary expenses of the trip which is very destructive to clothing, buggy, harness, horse shoes and horse flesh; besides the great deprivations to be suffered on the roads, travelers are obliged to take along horse feed, blankets, and provisions, to provide for camping out and living, (as there are only two places where a meal can be had, and one place where a bed can be had on the road), besides, persons not accustomed to the country are liable to illness from drinking bad water and from exposure to a burning sun. Moreover, Father Ubach is obliged to depend upon the meagre donations of an impoverished people for his expenses and trouble, which, on this trip, barely paid traveling expenses.

My opinion is, that if the Bishop of this diocese was to come here and make the trip once with Father Ubach, he would certainly endeavor to have him better paid, or relieve him of at least half the work;—and he would find but few who would undertake the arduous duties on those terms. Father Ubach submits to the requirements with Christian fortitude without a murmur, exhibiting a living example of religious devotion and piety through all the dangers and trials of the tour, never omitting his daily devotions and duties, but impressing all with whom he comes in contact with the firmness of his religious faith; at the same time I found him to be a most jovial and companionable traveling partner. Although born in Spain, and a thorough Spanish scholar, he speaks English fluently—is liberal in his ideas and well informed. In less than two days after leaving San Diego we arrived at

The Mining Town of San Rafael,

A place now containing over 400 inhabitants. The placer mines were discovered here in August last, and were found to be remarkably rich; a great deal of gold having been found on the surface in nuggets, varying from 50 cents up to \$7 or \$8 in value; and one was found worth \$104. All the gulches heading in a "Mesa," one mile and a half from town are rich, and would afford good return for mining, if a good sluice head of water could be had to work with. As it is, they are picking the dirt on the backs of animals and men, and occasionally carts are used to carry it to water, from a mile to a mile and a half distant. Many are making from one and a half to two dollars to ten dollars per day.

Some miners are working on quartz ledges, and occasionally strike pockets of ore extraordinarily rich. Seven pounds of ore, taken from the "Pueblo" claim, belonging to Señor Morena & Co., were pounded in a mortar and yielded \$124.50. They have not gone down on this ledge far enough yet to get a well-defined vein. Very rich specimens have been taken out from a number of claims in the vicinity; but only one or two well-defined ledges have yet been discovered.

The largest and best gold-bearing ledge I have seen in all the country, is the "St. Nicholas," which shows a cropping of from 15 to 25 feet in width. They have an incline shaft down 25 feet, about 6 feet square in size. The walls of the ledge are not touched in any place. All the rock, from croppings to bottom of shaft and drift, prospects gold, often showing free gold. The mining laws of Mexico are very liberal. Señor Sosa, President of the municipal organization of the Northern Dis-

trict of Lower California, Señor Leon, collector, and Ferraci C. de Maravilla, a merchant of San Rafael, are the principal owners.

It seems to me (having examined the ground) that a profitable operation could be made by any company that would undertake to throw the water from the creek on the placer mines. The elevation would not exceed 200 feet, and the distance not more than one mile and a half. I can give any party or parties definite information as to particulars if desired.

San Tomas.

We remained there nearly one week, then left for Santo Tomas, the Capitol, so called, of the district and residence of Lieutenant Governor Rojo. From there I rode on horseback thirty or forty miles south, to examine some copper, silver, and quicksilver mines that have been worked and abandoned long ago. Without particularizing, I found what seemed to be a rich mineral country, with granite formation generally, interspersed with belts of slate. The country is mostly barren, and there is a scarcity of wood and water for mining and milling purposes; although I found a few very fine valleys with plenty of water near by, if the ocean might be considered plenty, as it was within two miles, with good level country for road, and wood within a few miles.

Having thus given you, in a disconnected manner, a very short general idea of that portion of Lower California, I will close by saying a few words about our mines at home, in

Julian and Banner District.

The Warlock Co. (George McKean's mines), have bought the "Trail" ledge, which will enable them to keep their mill running constantly on good-paying ore. The three owners in this company are wide-awake, energetic men, and will make money fast in this operation. The "Chaparral Co." have a fine ledge in their shaft of ore, estimated worth \$50 per ton. The "Antelope" boys, of whom I spoke in my last, as being in San Francisco buying a mill, returned last month with a 5-stamp mill, engine, boiler and everything in complete order, manufactured at the Union Foundry. In less than four weeks from its arrival here, it was running, having no trouble in setting it up, it being so perfectly furnished and finished in all its parts, that being the usual style of turning off work by Booth & Co.

The first run they made, of 15 tons, turned out a large amount of amalgam. Having used some chemicals, and being inexperienced at the business, everything being new and rough, they amalgamated all the iron, and after retorting, sent it to San Francisco for separation and refining. They afterwards made another run, including refuse ore, that paid \$50 per ton, I am told.

The Madden Co. had 25 tons of ore worked in McMechan's mill, which paid \$50 per ton. They are now working in a body of ore as rich as was ever seen in the district. I saw a large block of quartz from their mine that was full of gold, and one side literally plastered with it. The "Kentuck" is as rich as ever, at 50 feet deep. McMechan and Redman's mine have worked about 40 tons of ore in the last few days, paying about \$60 per ton. In running in their tunnel from the lowest level, they have struck quite a stream of water, and the ore has changed its character very much, showing good silver ore now, with free gold plentifully distributed throughout, and the ledge from five to six feet in width. The Bailey Brother's claim, which is to the south end of the Redman ledge, shows the same character of ore, and on the 450-foot level, (their tunnel running in on their vein) have a six or eight-foot ledge. They have their ditch completed for their water power, and are saving their ore, until they get a turbine wheel and five stamps, to work their own rock.

The new discovery, which I called the King ledge in my last letter, but which is now called the Golden Chariot, made a trail to McMechan's mill and packed 12 13-20 tons of ore on jackasses, as taken out of their ledge, which returned \$181 per ton. The company have let a contract for making a wagon road from the mine to the mill, and will soon let the country hear from them on a more extensive scale. They are down 40 feet on their claim, and the rock is as good as ever, and ledges increasing in size. McMechan will soon have Varney pans attached to his mill, and then you will hear of much better results from the ores in this region. The "Van West," California, "Owens," and "Helvetia" companies, Julian district, are all looking well. This is a very

abridged account of our transactions, but having taken up too much of your space already, I defer further notice until another time.

Very truly, yours,

L. B. HOPKINS.

Julian City, May 29th, 1871.

Smelting at White Pine.

EDITORS PRESS:—A short time since a paragraph was published in the White Pine News in relation to the stoppage of the Alsop furnace, to the effect that it appeared that it would not pay to smelt the base ores of this district. As this statement was reprinted in your mining summary of June 3d, I deem it just that you should receive for publication the following facts, consisting of the figures of expenses and receipts of the last run of the said Alsop works, before the shutting down referred to. These figures were mostly obtained at the furnace at the close of the working on that occasion, and may be relied on as mainly correct:

Expenses.

20 tons high grade base ore, delivered at the furnace at \$22 per ton.....	\$440 00
9 tons second class, do at \$12 per ton.....	108 00
2 tons high grade at \$20 per ton.....	40 00
71 tons gray carbonate at \$11 per ton.....	781 00
1,930 bushels charcoal at 25c per bushel.....	482 50
7 men at \$4 per day for 10 days.....	280 00
6 men at \$3.50 per day for 10 days.....	210 00
7 dollars per hire for wood for boiler, 8 1/2 days.....	60 00
10 days horse hire for Superintendent at \$4.....	40 00
Sundries, oil, steel, hauling clay, etc.....	10 00
8 1/2 days rent of furnace at \$200 per month.....	50 00
Total.....	\$2,504 00

The bullion produced from the above amount of ore was 31 1/2 tons, for which the lessees of the furnace received an advance in Hamilton of \$90 per ton, making \$2,835.

Deductions.

Hauling 31 1/2 tons to Hamilton, at \$4 per ton.....	\$126 00
Assay of bullion.....	5 00
Freight of do. to San Francisco at \$35 per ton.....	1,103 00
Drayage in San Francisco at \$1 per ton.....	31 50
Loss by commissions, dross, etc., at 20 per cent.....	467 00
Expense acct. as above.....	2,504 00—4,236 50
Apparent loss.....	\$1,401 50

But the assays for the silver contained in the 31 1/2 tons of bullion showed 48 1/2, 57 and 60 ounces to the ton. We will take the average of those amounts, about 54 ounces, at \$1 per ounce, which will foot up:

31 1/2 tons at \$54 per ton.....	\$1,701 00
All deductions made.....	1,401 50
Net profits.....	\$299 50

Three hundred dollars profit on an investment of twenty-five hundred for ten days is about 12 per cent. or 36 per cent. a month. It strikes an impartial observer that any business man not inordinately avaricious ought to be satisfied with profits accumulated so rapidly.

But several of the deductions made are evidently too high. That for dross and commissions is manifestly so by at least one-half. This would make an addition to the profits of \$233. So with the freight to Hamilton. Then the silver yield may turn out better in the returns than the average sum taken in the above account.

The fact is, Messrs. Editors, our smelters are not content with the lion's share of the proceeds of our mines, which they were always sure of, have desired to use an expressive White Pine phrase, to "hog it all." How successful they have been in accomplishing the satisfaction of this desire, let the poor miners of this Base Metal Range of White Pine District answer. Many of these poor miners actually hold promissory notes and due bills of some of these very lessees of the Alsop furnace, and even of the proprietors of the great Rothschild Works in Hamilton, amounting to hundreds of dollars in each case. What the prospect is for payment may be known from the fact that the Rothschild Works were sold the other day for the benefit of the attaching creditors, among whom, of course, there were no miners. The latter class have no money wherewith to fee lawyers and pay Court expenses. And the reason they have none is manifest from the above recited facts. If smelting does not pay in White Pine, the miners think it ought, in all conscience, seeing that the smelting operators have obtained full half of their ore for nothing except the cost of hauling it to their furnaces. These operators, especially those who lease furnaces, have very little capital, less skill, and no honesty. They manage to get the bullion out of the way of attachment; and they have no other property to be attached, even if the miners could afford the expense of the process. The truth is the only people whom smelting does not pay in White Pine are the miners of the ore.

TRUTH-TELLER.
Shermantown, Nev., June 12, 1871.

Bull Run District.

EDS. PRESS:—Never did the mines of this district look better and promise more for the future, nor have more claims ever been worked at once, than now. We have about one hundred miners at work on the various ledges, and many more men are prospecting for new ledges, while two pack-trains are steadily employed carrying ore from here to Mountain City, and bringing back provisions as return freight. Such

Large Quantities of Ore

have been shipped from here in this way that we have been notified by Mr. P. F. Davis, the proprietor of Vance's mill, that he has more ore on hand than he can crush in six or eight months. His is the only dry-crushing mill at that place, and has to do all the work; for the miners here are not willing to have their ores worked by the wet process. On account of this large accumulation of ores at Mountain City, Mr. Norton proposes erecting

Roasting Furnaces

at his 10-stamp mill there, to enable him to work the ores from here; yet, notwithstanding this, there is an increasing demand for a first-class 10 or 20-stamp mill, and a good Stetefeldt furnace.

It has been said that Cope and Bull Run districts together cannot give steady employment to the mill already in operation at Mountain City. Allowing even this, for argument's sake, there are still great reasons for believing that a first-class mill would get even more ore than it could crush. The Auburn mill at Reno will buy ore assaying \$600 per ton, at 80 per cent. of assay value; also the Manhattan mill at Austin will work high-grade ores up to 90 and 94 per cent of assay value. The best we can do with the mill here is to have our ores worked up to 80 per cent. of assay value, and pay \$35 per ton for the process, while the other mills will buy the ore out and out for 80 per cent. of the assay value; thus the difference between a first-class and a second-class mill is at least \$30 per ton in favor of the former. Hence it will be seen, that if

A First-Class Mill

was erected here, the \$30, besides \$20 more for the freight we pay from here to Mountain City—the small sum of \$50 per ton—might be saved us, which would be a nice profit of itself. Yet, notwithstanding all these drawbacks, our claims are still being worked with success.

The work going on in our

Principal Mines

is as follows: The Blue Jacket is driving a tunnel to drain the main shaft; at the Foundry a very rich body of ore has been struck, and hundreds of tons of very high-grade ore are in sight; there is a very rich show of ore at the Monument too; the Johnson Co. is sinking an incline on their ledge, and taking out some very good ore; the Nevada Co. also are bringing out rich ore from their ledge, which is six feet wide, and gives a good show of minerals all through; the Norwich mine, is looking better than ever, it has been worked down forty feet on the ledge, and there is an abundance of ore in sight, which is better than that found at the surface; the Erie Co. are also at work on their ledge, which promises well. Many other companies are also at work, and more prospectors are coming in every day.

Lively times may be expected in Bull Run soon; for Mr. Norton, millman, and Mr. H. M. Grant, banker at Mountain City, have just visited this district, and are so much pleased with it that the latter, who has the management of the Norton mill, will erect furnaces, and roast ores from this place.

BULL RUN MINER.

June 5, 1871.

ANGORA GOATS IN THE MOUNTAINS.—Mr. Elijah Tompkins, says the Nevada Transcript, recently passed through Nevada with a herd of some 200 Angora goats, which he was taking to Bear Valley, where he proposes to remain with them the balance of this season and through next winter, with the view of testing the capacities of this animal to sustain high altitudes in this climate. With the exception of one full-blood buck and ewe and one pair of fifteen-sixteenths blood, his herd is half and three-quarter bloods. He intends to grade them up to fifteen-sixteenths, which he considers practically as good as pure blood, and the fleeces of which are said to be worth from \$10 to \$12 each. Mr. Tompkins thinks that Bear Valley will excel any place in the State for raising these goats, as it corresponds nearly to the elevated plains of their native country.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

SCHENECTADY MINE.—*Chronicle*, June 10th: We learn that the company intend shortly to commence the erection of a mill for the reduction of its ores.

AMADOR COUNTY.

CASCO MINE.—*Dispatch*, June 17th: J. R. Hardenberg, superintendent and owner of the Casco, at Middle Bar, contemplates starting up his mill again in a few weeks.

CALAVERAS COUNTY.

CONDITIONALLY SOLD.—*Chronicle*, June 17th: We are informed that the mine belonging to Matthews, Foster & Co., near Whisky Slide, has been conditionally sold to a company of San Francisco capitalists. An agent has made a thorough examination of the mine, and taken out a quantity of rock for crushing. Should the yield be satisfactory the sale will be consummated. A shaft 120 feet in depth has been sunk on the lead, and from top to bottom the rock makes a first-rate showing.

MOSQUITO GULCH.—Twelve tons of rock from the mine of Teusch & Mischler yielded \$1,505, retorted gold. This is an average of \$125.41 per ton. The quartz was crushed in Harris' mill at Sandy Gulch. Some of the richest pieces of rock we ever saw were recently shown us from the mine of Hoerchner, Siegler & Keyes. The pieces were about equally composed of gold and quartz.

The mining interest is more promising for the future and in a more favorable condition at present, than for years.

INYO COUNTY.

KEARSARGE.—*Independent*, June 10th: A rich strike has been made. At the lowest depth reached, a body of ore two feet wide has been opened, which is immensely rich. Before this development was made, Mr. Lockhart, an experienced mining engineer, had estimated the value of the ore in sight at \$1,400,000. The mill has been completely overhauled, and works to perfection. A 13½-inch Leffel wheel furnishes 40-horse power. The capacity of the mill is 30 tons per day.

EXTENSIVE OPERATIONS.—A New York company are making ready for putting up a furnace and reduction works on Cottonwood Creek, west of Owens' Lake, on a more extensive scale than any other in the county. They have already a building erected, and a strong force putting up another.

ITEMS.—Some of the buildings attached to Beaudry's smelting works were burned on the 6th inst. Loss \$10,000....Mr. Wingard, of the Silver Sprout Co., is in town, and proposes to resume operations on the mines, and start up the mill....Isaac Friedlander has made application for patent for the Eclipse mine.

NEVADA COUNTY.

NORTH SAN JUAN.—*Cor. of Transcript*, June 14th: The Consolidated claims of Messrs. Bowen, Davis, Beach and others, are being vigorously worked. These claims are paying handsome dividends. A few days ago they cleaned up but five boxes and took out seventeen hundred dollars in twenty days' run. The claims are worked with the Hopkins' pipe.

PLACER COUNTY.

GOLD.—*Stars and Stripes*, June 15: From Michigan Bluff, Turkey Hill and Last Chance the reports for the past week are encouraging in the extreme. From the Weske claim—twenty men working six days—the yield left to the owner a dividend of \$4,030 for the week. Weske now has about four feet in depth of pay dirt and there is every indication that he is on the eve of striking the main channel, when he is sanguine of a deposit far surpassing anything he has yet worked. Last Saturday, Hon. John Yule brought over from his claims near Last Chance to Michigan Bluff, \$1,740, the product of 133 days' work on the time-table. This gives \$36.75 per man per day as the yield of the Weske, and \$13.60 per man per day as the yield of the Yule claim, making no allowance for considerable dead work in both claims. In addition to the above, the Van Emmon brothers last week cleaned up 106 ounces in the Big Gnn claims, Michigan Bluff.

DUTCH FLAT.—Gold Run Cor. of same: I learn that Mallord has made a very profitable run. With four men and 300 inches of water he realized \$175 per day. This in bottom ground only, having one small cave from the main bank. A miner from Bear river informed me that very

rich diggings have been discovered twelve miles above this place. He reports many prospectors at work.

QUARTZ MILL SOLD.—*Herald*, June 17th: We learn that the St. Patrick Co. has bought from John McFadden the Empire Quartz Mill, in Ophir District.

PLUMAS COUNTY.

NEW TUNNEL.—*Quincy National*, June 10th: The Boardman tunnel in which big prospects were recently obtained, and which proves the existence of a very rich gravel range between La Porte and Gibsonville, has turned out to be too low, and arrangements have been made to run a new tunnel. Some very rich claims will undoubtedly be opened.

ITEMS.—*National*, June 17th: Pierce & Co., whose hydraulic claims are near the old Presby place, on the Honey Lake road, recently cleaned up over \$1,800 for forty days' work....The Eureka is paying out \$1,000 per day....Government patent has been applied for to the Washington Co.'s claim near Eureka.

SIERRA COUNTY.

RICH LEDGE.—*Messenger*, June 10th: Johnson & Co. have discovered another rich quartz ledge near American Hill. Some of the richest specimens ever found in this county have been taken out, consisting of solid chunks of pure gold.

GOOD DIGGINGS.—*Sierra Age*, June 17: At the Rattlesnake diggings, on the head of the Yuha, the Maul & Wedge Co. have averaged \$80 per week this spring and have not yet cleaned up. On the east side the Enterprise boys are yet piping and their show is splendid. The Empire Co. have taken out more gold than ever previously. The ground on each side of the ridge, to all appearances, is of unlimited extent.

TUOLUMNE COUNTY.

NICE THREE DAYS' WORK.—*Sonora Democrat*, 17th: We were shown on Monday at Wells, Fargo & Co.'s a lot of gold amounting to \$5,000, the result of three days' labor for two men in a pocket vein near Tuttletown. The larger portion had been pounded out in a mortar, and there was a respectable lump of amalgam.

YUBA COUNTY.

MINING NEWS.—*Appeal*, June 18th: We learn that the two main companies at Camptown are doing well. Jones & Co. and Hugg & Co. are both working a full force and reaping a fair return. Water is plenty. The little towns of Railroad, Young's Hill, Brandy City and other camps are all prosperous.

Nevada.

COPE DISTRICT.

MOUNTAIN CITY.—*Elko Independent*, June 17th: We learn from a gentleman at Mountain that prospects never looked better. He says the Independent is the richest mine on the coast. Sam Hendy's mine, the Pride of the West, is second to none. On Wednesday at the depth of 70 feet, the workmen struck an almost solid mass of silver. The Mountain City mine is in the near vicinity and the company will soon be taking out rich ore. The Argenta struck an 8-foot ledge a few days since in its lower tunnel.

ELY DISTRICT.

BULLION.—*Record*, June 15th: Wells, Fargo & Co. shipped, on June 12th and 14th, by the way of Salt Lake, bullion valued at \$35,465.96.

EUREKA DISTRICT.

PHENIX FURNACE.—*Sentinel*, 14th: This will be turning out bullion to-day, and promise is made that very rich will be the result.

EMMA ELIZABETH.—This is the name of a mine half a mile south of Vanderbilt, belonging to A. F. Jones of California. Mr. J., his wife and three children, have been at work on it for months, turning out little rough silver bars meanwhile enough to pay expenses, and now it is opened sufficiently to sell. Experts pronounce it good, and Mr. Jones will doubtless get a price which will make him comfortable for life.

MINING SALES.—Same of 15th: The Phenix Co. has purchased the Jenny Lynch mine at a round price. It is one of the latest discoveries made. Judge Delos Lake, of San Francisco, has purchased the Otho mine for \$12,000 coin.

SPRING VALLEY.—In this district, 10 miles west of Eureka, 200 mines have been recorded, and all of them more or less worked. The ore has been milled at Austin, and has paid a large profit even with the expense of 65 miles of transportation, where there is no return load.

EL DORADO SOLD.—Same of 18th: This mine has been sold by Daugherty and Capron to R. S. Bernard, for \$20,000. It is a good purchase.

REESE RIVER.

THE Reveille of June 16th says: The Citizens' mill is approaching completion. The boilers and engine, batteries and pans are in position, and a portion of the roasting apparatus is on the ground, the balance being expected within a couple of days. In two weeks more steam will be gotten up.

WASHOE.

OCCIDENTAL MINE AND MILL SOLD.—*Enterprise*, June 14th: James G. Fair and Mark Strouse have purchased the Occidental mine and mill, and will in a short time have both in full blast again. The mine is well opened and well drained and ventilated, and sufficient water flows from the main tunnel to run the mill. There are large reservoirs for saving tailings, and everything is in good order.

MILL SOLD.—We understand that the Buckeye Co. have purchased the mill formerly owned by the Hope Co., Silver City. It is a 10-stamp mill, almost new, and furnished with all the modern improvements.

BULLION.—There were yesterday received at the Bank of California, in this city, 10 bars of bullion from the works of the Carson Valley Tailing Co., valued at \$5,544.

IMPERIAL MINE.—No paying ore has yet been developed in the new prospecting drifts. They are now cross-cutting to the east from a "rise" from the 1,300-foot level.

NEW TAILINGS MILL.—Louis Japin, of Dayton, has torn down his old mill, known as the Reservoir mill, and is preparing to erect a first-class new mill on its site. A force of workmen is framing timbers, etc. The mill will be furnished with all the modern improvements.

NEW DEVELOPMENT IN THE SAVAGE.—Same of 17th: A new body of ore just developed at the 500-foot level, appears likely to prove of great value. A drift has been run into the deposit 15 feet, and a cross-cut made 12 feet, without finding wall or limit to the ore.

CALEDONIA.—This mine is now yielding from 80 to 100 tons of ore per day, which is being crushed at the Piute and Sapphire mills. This is from the 300-foot level and above. The ore breasts in this part of the mine are looking exceedingly well. The company have sunk a winze on the 300-foot level, near the Overman line, 120 feet, and from this they are drifting south to connect with their main shaft 300 feet distant.

GOULD AND CURRY.—Same of 18th: This company are deepening their shaft and are down three feet deeper than the old bottom. The rock is quite hard. A considerable amount of water is coming in, but not more than is easily drained by a 6-inch pump.

SUTRO TUNNEL.—The tunnel was yesterday in 2,127 feet. The ground is good and everything is progressing favorably.

ITEMS.—*Gold Hill News*, 19th: The new Lady Bryan Co. made the second clean-up on Saturday, yielding 2,700 ounces of crude bullion. This will leave over \$8,000 in the treasury. Last Friday they struck a deposit of better ore than they have yet been working, at the 80-foot level, south of the shaft, which promises to be extensive. The strike reported in the Savage mine, at the 500-foot level, near the Gould & Curry line, is said by those who know best, not to amount to much. They have struck hot water at the 10th or lowest level. The Hale & Norcross are getting along finely with the retimbering of their shaft, and have sunk their incline from the lowest level, about 80 feet. It is 50 feet south of the shaft.

WHITE PINE.

REVIEW.—*News*, June 17th: We have made a personal examination of the principal mines of Treasure Hill, this week, and find a marked improvement in all. In the Ward Beecher the ore in sight is pronounced by competent judges sufficient to keep the 60 stamps of the International mill running for the next six months. The Ward Beecher Consolidated is constantly shipping ore to the Manhattan and Dayton mills. The ore shute is completed, and everything about the mine is rapidly getting in shape for active working. The South Aurora is getting good ore, which is being daily shipped to the Stanford mill. The O. H. Treasure, Silver Wave, Silver Wedge, and other mines at the north end of the ore channel, are all developing fine bodies of ore. The tramway continues to run regularly, carrying large quantities of ore from the Ward Beecher, North Aurora and Eherhardt to the International mill, but notwithstanding this, there is a large number of quartz teams employed. Many more good miners than are now here can readily obtain employment. In the hills west of Hamilton some very good mines are developing. The Silver Plate, Truckee, and Bowie are sending high-grade ore reg-

ularly to the Big Smoky mill. The bullion shipments for the week foot up \$21,976.69.

Arizona.

BRADSHAW.—*Prescott Miner*, June 3d: The Tiger is being worked upon for a distance of six miles, and the ore from every shaft and tunnel is rich in silver and gold. The same is true of the Lion, Lioness, Cougar, Gray Eagle, Eclipse, Badger, Bradshaw, Del Pasco, Yreka, Hunter, Lorena, and other ledges. Scores of mining experts, from Nevada and California have visited these mines, and have said sufficient to satisfy us that they looked upon Bradshaw district as the greatest find ever made in any country.

We have good reports from the Davis mine, Hassayampa district, which at depth of over 100 feet, is 9 feet thick, and exceedingly rich.

From Big Bug, Walker, Weaver, Turkey Creek, Black Canyon, Black Hill, Santa Maria, the distant Wallapai, Salt and Colorado river district come cries of "rich rock, and plenty of it."

SALT RIVER.—M. W. T. Boyd writes us from Mill City, that a party of prospectors recently discovered two rich gold ledges, a short distance south: "We have tested only one of the ledges, which gives \$50 per ton, in free gold."

Colorado.

ITEMS.—*Herald*, June 7th: The shaft of Bennett, Gray & Root, on the Jones & Matteson, is 90 feet deep, and the pay crevice is 5 to 8 feet wide, with over 3 feet of smelting ore. Nearly 70 tons of first-class smelting ore have been taken out during the week, besides 18 or 20 cords of mill ore, yielding 7 ounces of gold to the cord....J. P. Hardesty, in the next claim east, is down 40 feet, and is taking out six-ounce mill ore....Cree, on the Kent Co., is said to have cleared \$300 last week....The mills of Nevada, Central and Black Hawk, now in operation, are crowded with ore....E. L. Saulsbury is running the Keith 20-stamp mill on North Clear Creek on custom ores. Sudeburg lode, worked by Nat. Young, gives, after the smelting ore has been taken out, 8 to 12 ounces of gold per cord.

FOUR-MILE CREEK.—*Caribou Post*, June 10th: The bed of this creek has long been worked for gulch gold, but with better success now than ever before. One party report an average of half an ounce per day to the man.

GOLD HILL.—In Follen's White Rock mine two men raise the ore nearly as fast as ten stamps can crush it.

CLEAR CREEK COUNTY.—Ten tons from the J. J. Roe, shipped to New York, yielded 500 ounces silver per ton. Two lots of 8 and 11 tons, worked by Palmer & Nichols, gave 105 and 107 ounces silver per ton....The Washington mill is running to its full capacity, with a supply ahead from the Brown and Terrible lodes, and the Monticello tunnel ore. The cost of concentration by the Krom machine is \$7 to \$8 per ton, and the capacity of the works ten tons per day.

CARIBOU MINE.—Same of 17th: The main shaft is now 180 feet deep and has a five feet crevice. The assay value of the ore from 130 to 180 feet is 300 ounces....The mine was discovered in the spring of 1870. Since that time \$240,000 worth of ore has been taken out, nearly all in developing the mine, for no stoping has been done in the last 80 feet, where the crevice is best.

The Idaho lode gives an average of 321½ ounces per ton.

GEORGETOWN.—*Miner*, June 7th: The Marshall Co. shipped during the past week 150 pounds of silver bullion, the product of 3½ tons of ore from the O. K. lode....Work is actively going on in the Marshall, Burleigh, Monticello, Eclipse, and several other tunnels....In the St. Luke lode, Sherman mountain, the pay streak is ten inches in width, and the lowest assay has been \$490 per ton....Terrible ore at lower depths has less zinc and more lead....Palmer & Nichols Reduction Works' bullion total for week, \$3,555....Last run of Mammoth ore returned 170 ounces per ton....Placer mining is in full blast in Summit county.

GOLD HILL.—*Register*, June 7th: Sleppler & Holt are working the Alamakee lode. At a depth of 30 feet, the crevice averages eight inches in width. Eleven loads of ore from this mine, lately run at Bottolfsen's mill, yielded ninety ounces of gold, or over 30 ounces per cord.

The ore from the Puzzle lode, Bobtail Hill, yields, under stamps, 20 ounces of gold per cord.

Four cords of ore from the "Beacon of the West," in Russell, gave 50 ounces of fine gold.

Idaho.

ITEMS.—*Avalanche*, June 10th: The Minner mill is being repaired and will be started up in a few days. The *Cosmos* mill started up on Wednesday, and the *Webfoot* on Thursday. Most of the ore now being taken from the Chariot comes from the fifth level south. A contract for the sinking the main shaft 100 deeper was to have been let yesterday. The new quartz yard will soon be completed. The working force in the Chariot will be largely increased next week. Work has been resumed on the Ida Elmore. Superintendent Hyde had succeeded in taking all the water from the Peck & Porter shaft, which is 300 feet deep. Stopping will immediately commence both north and south of the shaft, as the Mahogany Co., has conceded 71 feet of the north end of their claim to the Peck & Porter, whose shaft was formerly the boundary line between the two mines. Morrison & Co., are working on a ledge a few rods east of the Peck & Porter. Quite a pile of quartz has been taken from the tunnel, which is in 50 feet. War Eagle mill is running on Chariot ore but will commence on Peck & Porter Monday. Work is going on as usual in the Empiro, Skookum, Red Mountain, Illinois Central and Udola & Tallula Peck, on War Eagle mountain, and on the Ruby City and Boonville, on Florida mountain. Quite a number of newly discovered veins are being prospected. The warm weather has caused an abundance of water and the placer mines are all in full blast.

MAHOGANY MINE.—Things are assuming a lively appearance. Supt. Minner is pushing operations on the ground north of the claim held by Thompson, Cook & Co. The steam hoisting works formerly on the Allisou are being moved thither and will be running in ten days. Foreman Pete Nick is putting down a shaft. On Wednesday it was down 110 feet. Bob Morrison is sinking a shaft 300 feet south of Thompson & Co.'s and is down nearly 30 feet. We understand that the latter company have notified Morrison to cease work. Taken all in all, it looks as though serious trouble would yet arise out of the Mahogany complications. Perhaps another mining war.

SNAKE RIVER.—Owing to the rising of the water, the miners have been compelled to leave the low grounds and commence work on the more elevated bare.

BOISE BASIN.—*World*, June 8th: The Gold Hill Co.'s mill last Sunday, after a four week's run, cleaned up \$18,000. The Co. has no debts, and has abundant supplies of all kinds on hand. No stock for sale. The Co. has purchased the old Pioneer ledge from Mr. John Parham, paying him some \$2,500.

The assay office of B. M. Durrell & Co. of this city, assayed, during May, 152 gold bars valued at \$115,597.62. All this was Besin dust, and the yield only of the first month of the season.

Montana.

KNAPP'S BAR.—*Montanian*, June 8th: This is next above Pilgrim. Messrs. Knapp and Woods have a seventeen feet bank of gravel, 100 to 200 feet dump, and the best lay out for mining in the country.

BLACKFOOT.—*Cor. of New North West*, 10th: The camp is living up, and considerable money has already been taken out. The clean-ups we heard of were: O'Rourke & Hogan, \$1,300; Gallagher & Co., \$1,200; Dunn, \$1,200; Spears & Co., \$1,500; McDonald & Co., \$500; Shirley & Co., \$500; McCoy Bros., three of \$1,500 each. Smith & O'Rourke have sold their bed-rock flume in Ophir, to Sheldy, McCormick & Co., for \$3,000, and it will now run night and day.

JEFFERSON GULCH.—Harris Bros. have rather the best ground, and their only clean-up this spring yielded \$50 per day to the man. Seven pipes are running the gulch and several companies are ground sluicing.

CALIFORNIA GULCH.—With the exception of 400 feet, owned by Mr. Mead, the gulch is claimed by the California Flume Co., and is paying its four proprietors a handsome dividend. It is \$20 gravel and is extensive.

CARPENTER'S BAR.—Pounde & Co., are running 5 hydraulics and 24 men, have a telegraph flume half a mile in length, which has been put up at a cost of \$20,000. They intend to push their bed-rock flume up half a mile further and run the tailings off the lower ground. It is an extensive piece of work.

PILGRIM BAR.—The clean-ups, so far as learned, on Sunday, June 4th, were: Rowe & Bell, \$2,000; Catching & Smith, one flume with scarcely any bed-rock, \$1,500; Fisher & Co., \$700; Joe Steele & Co., \$1,100; Hogan & Co., \$1,000; Thos. H. Irvine

old $\frac{1}{2}$ interest in the Fisher & Breleford ground for \$5,000 cash.

BUTTE.—Apton & Hill cleaned up for their first run, (four men and one hydraulic) \$2,500, and for the second week \$6,000.

GERMAN GULCH.—*Independent*, June 9th: Every company is ground sluicing. The mine will average for the season, about \$12 per day to the haul, although some will pay double this.

FRENCH GULCH.—Allen & Co. have their hydraulic in operation, and are doing well. The other companies, are well pleased so far. The Spanish Co., on First Chance gulch, have one of the best claims in the Territory.

PIONEER.—Everything looks lively. Doc Young & Co., cleaned up \$2,640; the Pioneer Co. \$2,378; and the Dutch Co. \$2,182.

HENDERSON GULCH.—David Hennessey reports everything prosperous. Among clean-ups, he mentioned:—Shields & Co., \$900 for two weeks' run; Connors & Co., \$900 for fifteen days; Hennessey & Co., \$1,400 eighteen days; Butler & Co., \$500 for two days; Ferguson & Co., \$2,000 for fifteen days.

PHILLIPSBURG.—The Cole-Sanudere furnace is again in operation under favorable auspices. A project is on foot to erect stamps and concentrate the Trout ore, and ship it out of the Territory for reduction. Joseph Alger, Sec. of the St. Louis and M. M. Co., came in from Phillipsburg last night. He has just completed a run of 22 tons of rock from the Snager ledge—a new discovery—that yielded silver bars weighing 310 pounds, of the estimated value of \$4,800.

CEDAR CREEK.—We learn that claim No. 64 caved a few days ago, and Langenham's flume, was broken, allowing the water to fill up all the ground from 62 to 67, throwing 40 men out of employment. The price of ground in upper Cedar, as far up as Snow Shoe, has advanced greatly, owing to fine prospects obtained within the last three weeks.

Utah.

The *Corinne Journal* of June 16th says that Messrs. Alpey and others are opening a ledge seven miles northeast from that city, in the Wasatch range, which is fourteen feet wide and traceable 1,400. The ore is galena with streaks of chloride. Assay returns from samples just sent to Salt Lake are expected to be something remarkable.

REDUCTION WORKS.—Heffernan & Goff are putting forth their utmost exertions to complete their reduction works. They have on hand an immense quantity of fuel and ore.

A Salt Lake correspondent of the *Enterprise* writes June 11th of the Emma mine, that there are 150,000 tons of good melting ore on the dump; and of Ophir District, that the best of the ores yield an average of \$200 per ton, and there are many thousands of tons on dumps awaiting milling facilities, being not suitable for melting.

MACCARONI WHEAT.—Mr. S. Baker, who lives about four miles from Hollister, in Monterey county, has about 30 acres of this wheat growing on his place. Its yield is much greater than that of common wheat. A Mr. Nash, a year or two ago, sowed fifty pounds of this grain somewhere in Santa Clara Valley, and it yielded him fifty sacks. If the thirty acres which Mr. Baker has in does well, it is his intention to sow more next year. There is a mill in this city which prepares it for use. The grain is about three times the size of common wheat. In France this kind of wheat is ground into flour; here in California, and other parts of the United States, it is used for macaroni soup.

AGENTS CAN MAKE FROM \$1,000 TO \$5,000 A YEAR in almost any section of the country, selling Dana Bickford's new and improved FAMILY KNITTER. This Machine is guaranteed (in its present completeness) to meet every want of the household for either domestic or fancy work. Price \$25. Send stamped envelope with full directions for an illustrated book. Address: DANA BICKFORD, Vice President and General Agent, 689 Broadway, N. Y. 23v22-6m-hp

\$5 TO \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7 strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address: Hudson River Wire Works, 76 William street, N. Y., or 16 Dearborn street, Chicago, Ill. 23v1-12mhbp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 26th, 477 9th Ave. New York. Good work at high prices if desired. 23v1-12mhbp

PATENT BROKERS.—Inventors having valuable patents and needing reliable assistance in selling them should consult Webster & Co., No. 17, New Montgomery street, under the Grand Hotel, San Francisco.

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

—Advertised in this Journal.

READERS will favor ourselves and advertisers by mentioning the fact when they obtain information from our columns.

PSYCHOMANCY.—Any Lady or Gentleman can make \$1,000 a month, secure their own happiness and independence by reading Psychomancy, Fascination or Soul Charming, 400 pages. Full instructions to use this power over men or animals, at home or to Mesmeric, Mesmerism, Trance or Writing Mediums, Divination, Spiritualism, Alchemy, Philosophy of Omens, and Dreams, Brigham Young's Harem, Guide to Marriage, &c.; 200,000 sold. Sent by mail in cloth for \$1.25, paper covers, \$1.00. The Philadelphia Star speaking of the book says its author is HERBERT HAMILTON, B. A., the celebrated Psychological lecturer, and the publisher, T. W. EVANS, one of the oldest Publishers and Publishers in the city, the reputation of whose name is a sufficient guarantee of the merits of the work. MR. EVANS has spent \$50,000 already in advertising and getting out this extraordinary book. As in Psychology read and he convinced of this wonderful occult power.

NOTICE.—Any person willing to act as Agent will receive a sample copy FREE. As no capital is required, all desirous of the employment should send for the work, inclosing 10 cents for postage, to T. W. EVANS, 418 Eighth street, Philadelphia, Pa. mat-lamst

EVERY MECHANIC should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Scientific Press office, San Francisco. Bound in cloth. Price, (very low) post paid, \$1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference.

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Graphic* says: "Various European manufacturers have attempted to rival a reputation for their prepared Cocos, but we doubt whether any thorough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other cocoa in the market. Entirely soluble in water, delicate in taste, and of a concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable and valuable beverage." Sold in packets at all Grocers, of whom also may be had Taylor Brothers' Original Homeopathic Cocoa and Soluble Chocolates Steam Mills—Brick Lane, London. Export Chicory Mills, Bruges, Belgium. 16b-15

TO THE MINING INTEREST.—Believing that they can thereby aid the mining interest, the managers of the Eighth Industrial Exhibition of the Mechanics' Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and CAPITAL TO OUR MINES. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanics' Institute, care of J. H. GILMORE, San Francisco.

AN ESTABLISHED REMEDY.—"BROWN'S BRONCHIAL TROCHES" are widely known as an established remedy for Coughs, Colds, Bronchitis, Hoarseness, and other troubles of the Throat and Lungs. Their good reputation and extensive use has brought out imitations, represented to be the same. OBTAIN ONLY "Brown's Bronchial Troches."

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.50. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office. apl-hd-4f

ALL those who wish to see clear and distinct, should visit C. MULLER, No. 205 Montgomery street, where every description of glasses may be seen; and what is more desired than a good eyeglass to those whose optical illusion has been impaired?

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

Metallurgy and Ores.

Richardson & Co., Copper Ore Wharves, SWANSEA.

RICHARDSON & Co. have been for thirty years established in Swansea as Agents for the preparation, Sampling, Assaying, and Sale of Copper, Silver, Gold, Lead, Zinc, and all other Ores and Metals, for which they have extensive Warehouses and Wharves under cover, 1,000 feet of Quay Frontage within the Floating Dock, and the most complete Machinery and Appliances. They are also prepared to make advances against Ores in anticipation of realization, and to guarantee all payments when required. 5v21-lys

BETTS'S CAPSULE PATENTS.

To prevent INFRINGEMENTS, NOTICE IS HEREBY GIVEN, that BETTS'S NAME IS ON EVERY CAPSULE he makes for the principal merchants in England and France, thus enabling vendor, purchaser, and consumer, not only to identify the genuineness of the Capsule, but likewise the contents of the vessel to which it is applied. The Lord Chancellor, in his judgment, said that the Capsules are not used merely for the purpose of the ornament but that they are serviceable in protecting the wine from injury, and insuring its genuineness. MANUFACTURED BY—WILKINS ROAD, CITY ROAD, LONDON, AND BORDEAUX, FRANCE.

PATENTS & INVENTIONS.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING JUNE 1TH.

FURNACE FOR ROASTING ORES.—John P. Arey, Georgetown, Col. Ter.

BUCKLE.—George F. Stephens, Portland, Or., assignor to himself and John Nation, same place.

SEWING-MACHINE.—Hannah G. Suplee and John H. Mooney, San Francisco, Cal.

REPEATING ORDNANCE.—Alfred H. Townsend, Georgetown, Colorado Territory.

FURNACE FOR ROASTING ORES OF THE PRECIOUS METALS.—Jonas Sely Akin, Rye Patch, Nev.

MANUFACTURE OF PNEUMATIC GAS.—Homer Bloomfield, San Francisco, Cal.

PARLOR-SKATE.—Oliver Benjamin Oakley, San Francisco, Cal.

Sacramento Seminary.

The commencement exercises of this popular school, under the charge of Prof. Perry and wife, assisted by an able corps of teachers, took place in Temple Hall, Odd Fellows Temple, last week and was a great day in the history of the seminary. The beautiful hall was filled with nearly a thousand persons, representing the parents and guardians of the pupils, from all parts of the State, with the many friends of education and the seminary both in and out of the city.

Dr. Carr, of the State University, delivered a most massive and brilliant address on the importance of female education, claiming for woman the right of high mental culture, asking for her no change of sphere, no masculine endowment, but the privilege of being *clever* as well as good, and the acquisition of that varied power and influence that education can give.

The exercises of the occasion were in the following order:—Music—Instrumental duet, by Misses Lorenz and Lindsay; Prayer; Music—Anthem, "Praise the Lord;" Essay—by Miss Julia E. Lorenz, "The Ideal Our Beacon Light;" Essay—by Miss Rosa E. Caples, "Conscious Merit the Richest Reward;" Music—solo and chorus, "Sweet Vale of Rest;" Essay—by Miss Sallie E. Lindsay, "Moral Bravery;" Essay—by Miss Lizzie M. Avery, "The Mystery and Sublimity of Human Life;" Music—Instrumental, by Miss Rosa Caples; Conferring Diplomas; Music—Chorus, "The Angel's Serenade;" Address—by Prof. E. S. Carr; Music—Duet, instrumental, by Miss Ella Follett and Prof. G. J. Gee; Benediction. For two hours the audience, many of them standing, listened with wrapt interest to the exercises.

The essays by the graduates were all of a high order of excellence, showing correctness of thought and arrangement, united with beauty of diction. Where all were so commendable it seems hard to distinguish. If we should assign to any superiority over the others it would be to

the last essay, entitled the *Mystery and Sublimity of Human Life*. The music of the occasion delighted the fastidious, and received the praises of many eminent professors present, a class of persons by no means easy to please.

We attended the examination of the graduating class in the higher studies of their course and have witnessed no better examination anywhere. The young ladies showed, to all who were privileged with being present, that the years of study had not been in vain; that they had been years of discipline and culture; that the pupils had attained to a *status* of mind and manners that shed lustre on their *Alma Mater*, and which was to them the richest reward

FIRST CONSTRUCTION TRAIN PASSING THE PALISADES.
673 miles from San Francisco—Altitude 4,800 feet.

of toil. This seminary occupies a place with the best institutions of female education in this or the older States, and its course of studies (whilst so arranged as to afford assistance to any from the city or country who wish only to pursue a partial course) aims to add to the best intellectual and moral training those accomplishments that adorn life and add so much to personal influence and happiness.

Many additions have been made to the

ALCOVE IN PALISADES.
675 miles from San Francisco—Altitude 4,800 feet.

seminary, in making its appointments complete in the departments of music, drawing, painting and the modern languages. New grounds also have been added for a riding course, thus providing for the exercise and amusement of the pupils.

The buildings, erected expressly for the seminary, are located on the most beautiful site in the city, and few places can furnish a more delightful home for a young lady where the advantages of a liberal education may be enjoyed.

The next term of the seminary commences on the 1st of August.

YOUNG TROUT.—Last week, 3,000 young trout, from New York State, were placed in the fish-pond of Badlam & Conway, near Calistoga.

Editorial Notes Eastward.—7.

The Palisades.

Our lively friend, the Humboldt, whom we have been following so long, has prepared for us a mighty path. Some six miles before coming to the town of Palisade, we saw some high cliffs and rugged crests which excited our admiration as we rushed through Twelve-Mile Cañon, where the cutting is some of the heaviest we had ever seen. But all this vanished from our sight, and we entered the famous Palisades. Here our watery companion has been wearing away the rocks to a fearful extent, so that we shudder as we look upward from the platform of the car at the

TOP OF PALISADES.
675 miles from San Francisco—Altitude 4,800 feet.

jagged and overhanging cliffs, which threaten at every moment to fall upon and annihilate us. They received their name from the resemblance they bear to the renowned upright walls of rock on the Hudson river.

At several points in the side of the cliffs, we see large hollows, or caves, where the rock has crumbled and fallen away, and we wonder what hobgoblins, or spirits of the glen, make these their trysting-place. The

PALISADES ACROSS CANYON.
680 miles from San Francisco—Altitude 4,800 feet.

largest of these wierd caverns is called the Alcove.

While these things have been occupying our thoughts, the sturdy locomotive has been puffing away at its arduous task of dragging our heavy train up the steep grade, and we now have attained the altitude of 4,800 feet above the sea. Now we begin to descend, and the scene changes from steep, bold precipices to low, rounded hills, around whose sloping bases our iron path is bent. Our best view of the Palisades is through a gap in the rock, and across the cañon, where they are to be seen in all their vast proportions.

Our old friend, the Humboldt, keeps along with us, on our right hand now, and

increases in size as it flows onward. Carlin is passed, and before long we stop to dine at Elko; thence we travel on in a happier mood, until night overtakes us, and the sight-gazing is stopped for that day. We turn into our bunk to dream of rushing cataracts, and wild sprites trying to make us leap yawning chasms of endless depth, while the proper accompaniment of deep thunder is supplied by our snoring neighbor in the next section.

Breeding Gold Fish.

A correspondent of the *Scottish Farmer* says:—A friend of mine some years ago constructed a tank about sixteen feet long,

and between four and five feet broad, by three feet deep, which he stocked with fish, but they did not breed. I suggested to him that gold fish were very fond of eating their own young, and that if he wanted to breed fish he must have the means of separating the old from the young. I also advised him to stretch across the tank a partition of wire-work, with a mesh small enough to prevent the large fish from pushing through, at the same time giving the young fry an opportunity of getting into a secure place. This answered the purpose perfectly, and they bred in numbers.

Gold fish should be kept in water of an even temperature—neither too warm nor too cold. A very small quantity of the white of an egg, broken up into minute particles, is sufficient daily food for some half-dozen fish. To this a very small quantity of pounded vermicelli may be added.

TEA CULTURE AT THE SOUTH.—If Californians do not hurry up matters in regard to tea culture, the Atlantic States will get ahead of them. The Commissioner of Agriculture, at Washington reports that tea culture is fast becoming a feature of importance in the Southern and Southwestern States, and that in a few years enough tea will be grown in those sections to meet the home consumption. Over forty thousand tea plants have been distributed by the department, nearly all of which flourished, and now the seed from plants raised in South California are being sent out to supply the demand. Experiments have shown very conclusively that this country can make itself quite independent of China in this important article of consumption.

OUR LAUREL WOOD.— The San José Mercury

says that there is reason to believe that our beautiful laurel wood will soon disappear from this country. Its superiority for fine cabinet work, over almost every other known ornamental wood, is rapidly coming to be appreciated throughout the world. That paper is informed that English dealers are quickly buying up large quantities of this wood for shipment. If such is the fact, some effort should be made to prevent the skinning of the country of this valuable timber. At least, in our forest tree planting, care should be taken that the laurel tree is not forgotten; so that its waste may be made good by cultivation. A laurel wood forest, thirty or fifty years hence, would be a princely fortune to the owner.

POPULAR LECTURES.

War Correspondents.

[Prof. SWINTON before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Reported expressly for the PRESS.]

LEC. I., June 17.—As a relaxation from the heavier topics of Mathematics and Greek, Prof. Swinton, formerly editor and war correspondent of the *N. Y. Times*, also author of "Decisive Battles," and "Campaigns of the Army of the Potomac," treated the students of the Mechanic Arts College to a series of interesting pictures from which the following have been selected:

He said, I believe our war is the first that can be said to have been reported. True, when the Crimean struggle was going on—that contest that used to look so large to us, but which in contrast with our own assumes rather the character of a tempest in a teapot—the *London Times* did send Mr. Russell, afterwards of Bull Run notoriety, to chronicle the resounding exploits of our British friends on the shores of the Black Sea; and the *London Times* was so astounded at its own enterprise, that it has not got over cackling about it yet. [Laughter.]

The war correspondents, of course, were just like the rest of mankind—some good, and some bad, and some indifferent. As a rule, they were

All Rather Green at First,

And used to swallow the stories of the "reliable contraband" and the intelligent deserter with an avidity which much experience afterwards dashes with a very considerable epice of skepticism.

But let us do justice to our friends, the correspondents, for they deserve it—a quick-eyed, nimble-fingered, indefatigable sort of fellows, who would dash off a battle-scene on the pomells of their saddles, ride twenty miles to put it *en route* to their paper, and be back before morning to gather the list of killed and wounded.

As to Their Reliability.

To be sure, they had their little weaknesses. It sometimes happened that the particular Brigadier General who had the honor of supplying them with their rations and their whisky, assumed in their reports martial proportions compared with which the great god of war would appear at somewhat of a disadvantage. But I need not say that there were wanting men among the corps of war correspondents impervious to the seduction even of rations and rye; men really worthy their high function; men who brought intelligent appreciation and literary skill and love of truth to their work; and there were, necessarily under the circumstances, in the best and truest they could write, many errors and misconceptions, half-judgments and false judgments, yet there was also that which, without these contemporary photographs the world and literature could never have possessed—I mean the life and spirit and movement of actions and events; nor is it to be doubted that when those records and reports shall have passed through the crucible of criticism, there will remain a large residuum which the historic muse will gladly garner in her golden urn.

The conventional style and white plumed generale of popular war historians like Headley and Abbott were alluded to, and the speaker continued.

The Stags Effect Removed.

Now that sort of a thing is amazingly fine reading, and you have no idea what amazingly easy writing it is; I believe it is quite captivating to young ladies, and to youths at the age when they are contemplating running off and becoming pirates in the Spanish main. But wouldn't it be uncommon good fun to have one of those imaginative historical fellows present at a real battle and to witness his chop-fallen wonderment at the plain prose and dreadful realism of the thing? Now, if in place of the heroic, redoubtable and Godlike Pumpernickel, it were Meade or Grant or Sherman or Thomas, who were present, and if instead of some battle in cloud-land, it were Shiloh or Chancellorsville, Gettysburg or the Wilderness, it is quite certain

First—That my historic gentleman would not see the commander with the "white plume"—most likely with the stump of a cigar (and if the historian wishes a really characteristic, though I admit not quite so picturesque, bit of color in his descriptions, I advise him to substitute this for the ether); for while I have seen many a great captain doing fine things in the storm and stress of battle, with a stump of a cigar in his mouth, it was never once my

good fortune to behold one with a white plume. [Merriment.]

The Commander in the Rear.

Secondly—That he would not behold the commander in the rear—more likely from three to five miles in the rear—sitting on some stump, or in a house, if such were handy, unable in all probability to see a single man in line of battle and dependent for his knowledge of the mixed and broken fight on occasional messages from the subordinate officers, or perhaps on the field telegraph run to his headquarters. I prick this illusion with extreme regret—a plain gentleman at the end of a telegraph wire is a spectacle so disgustingly unimposing, compared with the image of Saladin or a Henry of Navarre!

Thirdly—That he would hear no grand speeches about "God defending the right," etc.; but only plain, blunt phrases, or, if things become hot and feeling mounted into the upper registers, some sharp, curt oath or exclamation. "Our army swore terribly in Flanders."

Fourthly—That he would not see the chieftain raising his sword to heaven; but, if he had a sword (which would be exceedingly dubious), he would in all probability be using it to whack the shoulders of some patriot who had straggled from the ranks, to chew a succulent and seductive turnip in a neighboring field. [Great laughter.]

Fifthly—That he would not see any "scrried columns"—whatever they may be; but one or two skirmish lines or open lines of battle, and as they would probably be moving to attack a force which would most likely be ensconced behind rude earthen parapets, thrown up an hour before, by aid of tin plates or other convenient implements, the chances are, that instead of showing off their gleaming bayonets, they would be using their rifles with busiest endeavor to clear their front.

Bayonet Charges a Rarity.

Sixthly—Apropos of bayonets. I don't say that there were not in the war some real bayonet charges; but they were exceedingly rare, and my historical gentleman would be in great luck if he chanced to see one; he should, therefore, be careful not to bring in a bayonet charge, as a *piece de resistance*, in all his battle scenes. I believe I am not wrong in saying that by far the greater number of bayonet hurts during the war were made by careless fellows who, on the march, would chance to bring the peaked thing in contact with some comrade in front, whom they would thus wound in that place which is popularly supposed to be honor's peculiar seat.

No Spectacles.

Seventhly—There was very little "spectacle" in the battles; for the ground where they were generally fought was so broken and masked by woods that but little of war's array was visible.

No Grape Shot.

Eighthly—He would not be able to see a grape shot, and that for the simple but conclusive enough reason that on neither side, in no battle, from Bull Run to Appomattox, was there even a single ounce of grape shot used. This is unfortunate, for "give 'em a little more grape, Captain Buzzard" does not come in so neatly in a bit of description.

No Theatricals.

Ninthly—That he would not see soldiers, whether chieftain or subaltern, strutting in theatrical attitudes or venting themselves in grandiose speeches in the "Ercles' vein" and if they had heard my friend prating about their being "eager for the fray"—which, by the way, is a favorite phrase of your imaginative historian—they would have incontinently laughed at him.

No Strategic Combinations.

*Tenthly—He would notice a curious inversion of what he had supposed was the order or conduct of a battle. For he would soon begin with wonderment to perceive that instead of being an affair of profound plan and grand strategic combination, it was really a

Fight by Piecemeal.

In which each corps and division and brigade was going in, "on its own hook," and the result of which was far more dependent on the special work of obscure subordinates than on the rot which the historians prate of under the name of "echelon formations," "oblique orders of battle," and the rest of the jargon these gentry use without knowing the meaning of.

The remainder of Prof. Swinton's discourse was devoted to anecdotes of the war, the circumstances of which had come under the personal observation of the speaker, a running review of the various campaigns of the Army of the Potomac, from the battle of Antietam to the close of the war.

His next lecture will be on Saturday evening, on "English Literature."

GOOD HEALTH.

Diet.

EDITORS PRESS:—"Weave the tissue of the organisms out of material that will not tear," is a sentence that occurs in my last communication, and as it may appear not to sufficiently explain the way to avoid death by hemorrhage or ulceration of the lungs, something further upon the subject may be admissible.

To be plain, the diet of the majority of Americans, and of some others, is largely composed of substances from which too much of the fibrous constituents have been extracted; or, in other words, they live too much upon fine flour and fatty or oily substances. Then, with reference to the use of pork, there must have been some good reason for the Israelitish exclusion of the swine as food. Modern science supports the position also. It requires five hours to digest such food, so that those who take three meals per day, each of which consists in part of the "unclean thing" in some shape, either as shortening or otherwise, require fifteen hours out of the twenty-four for constant exercise of the digestive organs. Now laboring communities are convulsed over even a ten hours' labor system; and why should it be expected that Nature will not at times rebel against an overtax of work? So again with the heart and lungs, when fatty, oily or carbonaceous articles are in excess of the natural requirements, the lungs and heart are compelled to do an excess of work.

It would appear that very little reflection is required to convince the most unreasonable that periods of comparative rest from labor should be allowed to all the functions; but when we live in such a manner that some of them get no rest, is it to be wondered at that the machine soon wears out? Life is sweet to most of us; and that theory which would engraft the "short life and merry" principle into every thing is obnoxious.

Many years since I adopted a belief that the principle of justice, both moral and physical, was a principle like the water of the ocean, or like that other great ocean of unseen force that is always seeking a level or an equilibrium—electricity; and however much we sin against its laws, they are none the less arbitrary. We may crowd the pendulum of justice or compensation as far to one side as we will, but it will eventually swing back, and sometimes, if not often, sweep in its swing all of man's puny piles that obstruct it. Millions of human lives have been thus sacrificed.

Another reason for the disuse of pork as an article of diet, which is not altogether fanciful, may be stated thus:—*Scrofula* is the Latin for a sow; and that the disease known under the term of "scrofula," originates in the use of the flesh and fat of swine, in a great measure, is undoubted. The weakest organ must receive the disease when the general taint tends to a fatal malady; as tight-lacing in women, and smoking in men, has for many years tended to lessen the capacity of the lungs, they are the organ which suffers most. These plain hints can do no one any harm, and, if they are heeded, may save many from that dread disorder known as consumption.

F. M. SHAW.

San Diego, Feb. 12th, 1871.

Effect of Stimulants on the System.

The effects of alcohol on the healthy human body have recently been carefully observed by Drs. Parkes and Wollowicz, of the British army. One or two fluid ounces of the stimulant, per day, increased the appetite; while four or more ounces sensibly diminished it; the effect was more marked with brandy than with rectified spirits. Digestion was not, however, impeded or the temperature lowered; but though there were strong feelings of warmth in the stomach, face, etc., it is not clear that the temperature was increased. No direct effect upon the nervous system was shown by the elimination of phosphoric acid, caused by the action of the brain; but the physical state of the body changed with the size of the dose; narcotism being strongly developed when the first very small amounts were exceeded.

The effect upon the heart was extraordinary. The experiments extended over a period of twenty-six days; and during eight of them, when water alone was drunk, the heart-beats averaged per day

106,000; with alcohol, in the six following, they were 127,000; and with brandy they subsequently reached 131,000. The daily work of the heart is about one hundred and twenty-two tons, lifted one foot (or 122 foot-tons); its extra work was in the alcoholic period 15.8 foot-tons per day, and in the brandy period 24 foot-tons.

In closing, the observers give it as their opinion that the loss of appetite, the greater rapidity in the heart-beats, and the narcotism are "all owing to nervous implications," and add, "we were hardly prepared for the ease with which the appetite may be destroyed and the heart unduly excited."

Dyspepsia and its Remedies.

Dr. A. O'Leary lectured recently at Cooper Institute, New York, on "Dyspepsia." Indications of disturbance of the stomach are, he said, caused by the fermentation of food. No one should eat cabbage hoiled with meat, or onions with steaks, as they create biliousness. Cabbage is one of the best articles of food when it is cooked properly. It should be boiled in pure water. As a cure for dyspepsia he recommended a teaspoonful of carbonate of soda, which neutralizes the acid in the stomach. The causes of dyspepsia are the use of butter, grease, gravy, and eating too hastily. Dyspepsia does not come from large eating. Those afflicted with it should take a short sleep after dinner. The liver has much to do with dyspepsia. Whenever the white of the eye shows a yellow tinge, it proceeds from the liver; tenderness in the pit of the stomach is an indication of a diseased liver. A slight pain under the right ribs and back to the shoulder blade, also proceeds from the liver. Those that are prone to this disease should not sleep too much, or enjoy too much heat—too much heat tends to enlarge the liver. Fruit and vegetable diet is the best that can be adopted; but persons of a weak constitution should add to it meat once a day, but not oftener, and bread if properly made. Persons afflicted with dyspepsia should not use calomel. The lecturer recommended Turkish baths to be taken, as they relieve the liver.

Labor Conducive to Long Life.

In view of the short duration of life entailed by some occupations, it must be regarded as a consoling, yea, a sublime fact, that labor in general does not tend to shorten life; but, on the contrary, by strengthening health, lengthens life; while on the other hand, idleness and luxury are productive of the same results as the most unhealthy occupations. Dr. Guy, an Englishman, in calculating the average duration of life in the wealthy classes, arrived at the very surprising result with regard to adults, that the higher the position in the social scale, the more unlimited their means, the less the probability of a long life.

We have so long been accustomed to consider the possession of riches as the best guarantee for physical welfare, that many will be surprised to hear that "the probability of the duration of life lessens, with regard to adults in each class of the population, in the same degree as the beneficial impulse for occupation is lacking. If a person who for a long time has lived an active life, retires from business, it may be taken for granted, with a probability of ten to one, that he has seized the most effective means to shorten his life." We may smile at the soap maker who, after having formerly retired from business, went nevertheless, on each day of soap-boiling, to his workshop; but it must also be acknowledged that his instinct did not mislead him. Of all conditions of life, idleness is hardest for nature to combat; and this is especially true of persons who have accustomed themselves to a busy life.

NAIL IN THE FOOT.—We give the following for what it is worth:—"To relieve from the terrible effect of running a nail in the foot of man or horse, take peach leaves, bruise them, apply to the wound, and confine with a bandage. They cure as if by magic. Renew the application twice a day, if necessary; but one application usually does the work. I have cured both man and horse, in a few hours, when they were apparently on the point of having lockjaw."—*Ex.*

THE LAWS OF HEALTH are simply the laws of Nature. This is the principle on which the intelligent management of the body rests. Our powers being Nature's powers, are subjected to the same conditions which pervade the rest of the world.

Velocity of Steam.

In answer to several inquiries concerning the velocity of steam under various pressures, we give the following table, taken from Bourrie's "Handbook of the Steam Engine."

Velocity of Flow of Steam into the Atmosphere			
Press. above Atmosphere.	Velocity per second.	Press. above Atmosphere.	Velocity per second.
Lbs.	Feet.	Lbs.	Feet.
1	482	50	1791
2	663	60	1838
3	791	70	1877
4	890	80	1919
5	973	90	1956
10	1241	100	1987
20	1504	110	1972
30	1643	120	1990
40	1729	130	2004

This table is computed by taking the difference of the pressures of the steam and the atmosphere, (that of the latter being about 15 lbs. to the square inch) for the effective pressure, which effective pressure is expressed in pounds per square inch, divided by the weight of a cubic foot of the denser fluid in pounds, and the square root of the quotient is multiplied by 96. The more dense the steam is, the larger becomes the mass of matter which a given pressure has to move. With steam of 16 lbs. pressure, flowing into steam or air of 15 lbs. pressure, the moving pressure is 1 lb., and the velocity of efflux is 482 feet per second. The denser the fluids are, however, the less will be the velocity of efflux which a given difference of pressure will create. With steam of 101 lbs. pressure, flowing into steam or air of 100 lbs. pressure, the moving pressure is the same, but the velocity of efflux will be only 207 feet per second.

J. A. S., Central Cal.—Probably a small Hess (grinder) pan would answer best, though as others would do if you have special pulverizing machinery.

PUT THROUGH THE ISTHMS CANAL.—There has been so much surveying and hesitancy and talk of impossibilities in this connection, that the world is getting tired of it. Let the government send for a few California ditch men, to show the engineers how it is practicable and a simple matter to feed the canal with water from sources surely not further removed than those tapped by our enterprising miners, and it will be found no great problem to out a canal for the paltry fifty miles, where such national ends are at stake.

Something New in Ore-Washing.

"Concentration of Sulphurets" has developed such innumerable varieties of machines that anything quite original in that line was long since deemed an impossibility. But here is a machine invented by Mr. C. Coleman, of Nevada City, that looks like a novelty, and is not without excellent points. It is on exhibition at No. 531 California street, in a two-foot model:

A cylinder like a cannon, 20 ft. long and 8 ft. in diameter, its inside in the form of a screw; that is lined throughout with a spiral thread, like that of the female screw.

The pulp from a 20-stamp mill being turned into the cylinder at one end, which is quarter closed by a diaphragm; the other end of the cylinder is raised a little, and the cylinder is set revolving. At the same time some fresh water is introduced and distributed evenly inside from the opposite end. The operation is that of clean water running upon the dirty water, and together out of the cylinder over the edge of the diaphragm at the lower end, at the same time that the screw is moving the heaviest particles along up grade, and towards the elevated end, against the flow of the water, which overflows from rifle to rifle—such being the secondary and rather important role of the screw-threads.

Take any single heavy particle introduced, as a grain of pyrites or a nail; it is compelled to travel the whole length of the screw without any possibility of escape, except by being lifted, in consequence of its lightness, over the side of its own particular sluice into the next one following; the clean water playing constantly against it, down each sluice; the pipe jetting it according to judgment against the inside of the cylinder on that side which is rising. There being four threads or grooves to the foot, (the sluice three inches wide) and a circumference of 24 feet, the total length of the sluice necessary to be traveled by the particle would be 24x4x20, or 1720 feet, which is a third of a mile in a straight sluice.

The machine is very simple and cheap, being made of wood, the screw parts included. For the latter nothing more is requisite than the nailing on of slats in spiral continuation inside of the cylinder.

Less water seems to be required in this than in any machine with which we are acquainted. As to its practical results, we know nothing further than the reported successful operation of a machine six feet long and three feet in diameter at one of the quartz mills near Nevada City. Its continuousness of operation, and self discharging, are of course decided advantages. The lumber requisite for a sluice of 1720 feet would cost, it is evident, only about a third as much, constructed in this manner, as it would in a straight line, since the side of the sluice at any one point forms also the side of the next screw or groove compartment; so saving the lumber of one of the sides. On the other hand the machine requires motive power.

A 20-foot machine, 8 feet in diameter, costs \$300, and is estimated to separate effectually all the pulp that a 20-stamp mill can deliver.

MR. WILLIAM H. MURRAY, special correspondent and agent for the San Francisco SCIENTIFIC PRESS and PACIFIC RURAL PRESS, both issued from the one office, in that city, was among the arrivals yesterday. The SCIENTIFIC PRESS has acquired the reputation of being the best practical mining journal in the United States, and the only illustrated mechanical and industrial newspaper west of the Rocky mountains. The PACIFIC RURAL PRESS is a wide-awake publication, devoted to farming, and all industrial interests. Mr. Murray, who comes to us favorably endorsed, will canvass different sections of our territory for subscriptions to these publications, furnishing the publishers with occasional letters descriptive of our agricultural, pastoral, and mining resources.—*Rocky Mountain News*, Denver, Col., June 11, 1871.

Ageing Wine—An Important Invention.

One of the greatest drawbacks in the manufacture of wine is the length of time required to give "age" to the product. One and two years is the time usually considered necessary for "ageing" to an extent sufficient to determine the true character of the wine, so that it can be advantageously placed in the market. And any additional delay beyond that time is considered equivalent to adding a good rate of interest to the value of the product.

Time is money. Now if we can introduce a process which can be applied to the wine, say within two or three months from the time the juice is expressed, which will immediately give to it the "age" of two, three or four years, that process is worth the interest on the original cost of the wine for the time so saved, added to the cost of storage, insurance, etc. It moreover releases the amount of capital otherwise stored up in cellars and vaults, and allows it to be put to active use, whereby it may earn more than the mere interest of the money, to say nothing of the benefit it will be to the community in giving additional employment to labor.

Many plans have been devised to reach this end, and generally with more or less success. It has been for many years the custom of wealthy ship owners and others to place a few casks of wine on board of a ship, and allow it to take long voyages out and back. It was found that wine so treated "aged" very rapidly; but the process is quite too expensive to be adopted to any great extent.

Acting upon this hint, however, Mr. R. d'Heuruse, then of this city, took out a patent for what he called the "Air Treatment," by which air was forced up through the wine from below, and the ageing thus hastened.

The "Heating Process" was subsequently added to the air treatment, by which it is contended the minute vegetable organisms upon which fermentation depends, are killed. The wine, after being fermented either in the natural way or by the forced air treatment, is raised to a temperature of 120° or 140° F., and kept in that condition for half an hour, after which, it is claimed, there is no danger of the wine entering into the acetic fermentation, and becoming sour. This process, however, seems only to delay the acetic fermentation, for a greater or less length of time, the duration of which seems not to be well ascertained. Still, for a time, the process seems to accomplish the end desired. If we had space, or if this was the proper time to enter into such a discussion, we might give what we think may be some very good reasons why the heating process does not make a stable wine.

But our present purpose is to call attention to a new invention, or rather discovery, which we think accomplishes the object more fully, more promptly and more cheaply than anything yet devised—in fact one which we think performs the work of ageing perfectly; as much so as is done when the wine is simply allowed to rest, and acquire its "age" by the actual lapse of time.

There is an interesting fact connected with the history of this invention which we may give just here. Like many others, it chanced to have been hit upon by two parties at the same time—one in this city and the other in New York. The parties in this city were Messrs. William Neil and J. L. Constable, who applied through the MINING AND SCIENTIFIC AGENCY for their patent. When the papers were made out and sent to Washington, it was found that a party in New York had just before patented precisely the same thing. Negotiations were immediately entered upon by the parties here for securing the use of the patent, and Mr. Constable went to New York some few weeks since to consummate the arrangement. In due time he telegraphed that the business had been completed.

This process is also equally applicable to ageing whisky and brandy, and we understand a large apparatus is now about ready to go into operation in this city, from which we shall probably be able to report results in the course of a few days.

In our next we will endeavor to describe this new process, explain the philosophy of the same, and offer a few remarks upon the advantages which must accrue from its introduction here.

Railroads Universal.

It is useless to attempt to summarise all that is going on in the railroad way. Like common roads, and like paths and trails that gradually become more and finally much frequented by the multiplication and influx of people, like frost net-work upon the windows on a wintry day, railroads are extending and interlacing everywhere, and in every country on the globe, including Shem's and Ham's, though not yet quite in the heart of the latter. We could stop to note Brigham's Southern Railroad and the Overland California Pacific; but on top of earnest doings in progress by the Northern Pacific and by the Texas Pacific, which companies all "mean business," we are told that Harry Meiggs is alive and active in the Peruvian Andes somewhere; that the Vancouver and Canadian Dominion surveyors, with a geological corps attached, are beginning their work eastward from the Pacific end of their pet route; that Mr. Fred A. Lane, one of the Directors of the Erie Railroad, has resigned and gone to Brazil, with a corps of engineers, to survey and direct a Brazilian transcontinental railroad, to be constructed by a party of English capitalists; and we are forced to shut down on the equally important (to themselves) Australian works, now reported to us firstly by steamer direct; and to ignore our brethren's great schemes in Mexico and Russia. Cheap excursion tickets and Great Easterns are in order.

NEW MANUFACTURE OF PLANING MACHINERY.

—We are pleased to note any new enterprise, especially in manufacturing, which is one of the great needs of California and the other Pacific States. The manufacture of wood-working, labor-saving machinery is a large industry in the Eastern States. Hitherto California has been a good market for considerable of this class of machinery, although but a drop in the bucket compared with the large field for such productions in the others—especially in the great Western States. A young house, comparatively, (Berry & Place) whose name has figured prominently in our advertising columns the past three years, and which has made the importation and sale of improved wood-working machinery a specialty, is now about to engage in its manufacture. Of course, the field is limited, and they will therefore confine the business to the manufacture of only such machines as can be built here at such prices as will best compete with the Eastern-made—such as Woodworth planers, sawhewers, shapers, etc. They have gotten up some fine patterns, and are now completing arrangements for their manufacture.

These gentlemen evidently understand their business. They came from the East some three years ago—Mr. Place being a thorough business man and Mr. Berry a practical mechanic. From nothing they have built up a business which aggregates several hundred thousand dollars yearly. They have "reached out" for trade, and understanding the value of advertising liberally, they have the satisfaction of a growing business from the start, even in the dull seasons. Such pluck and energy are deserving of success, and we hope that in adding manufacturing to their business, they may be equally as successful as they have been in the importation and sale of machinery.

BISMUTH IN NEVADA.—Mr. Melville Atwood has presented us with a specimen of bismuth from the vicinity of White Pine, Nevada. This is a new and important discovery, and we are not yet given the exact locality. The carbonate is the predominant mineral with some native bismuth. The metal is worth about 16 shillings (\$4) per pound in England.

The Saw Tooth Controversy.

On Saturday last, in the U. S. Circuit Court in this city, Hon. Lorenzo Sawyer presiding, three cases in equity brought by N. W. Spaulding against Wm. Tucker and S. O. Putnam, agents of the American Saw Company of New York, for *selling*, and against Nathaniel Pago and others and J. R. Duff and others, for *using* saws manufactured by the American Saw Company, were decided in the plaintiff's (Spaulding's) favor, and decrees were ordered to be entered in each case *perpetually enjoining* the defendants from *using* or *dealing* in inserted tooth saws having sockets rounded or formed on circular lines. Also for an accounting to the plaintiff of what profits the defendants had made or saved by the unlawful using or selling of his invention.

The defendants in their answers denied the validity of Spaulding's patent, and set forth that Spaulding's alleged invention was old—that it had been in public use at various times and places prior to his alleged invention of it, and gave the names of a large number of witnesses residing at the East by whom they alleged this fact would be proven. The testimony of these witnesses, and that of others in rebuttal, was taken in New York about a year ago, M. A. Wheaton and Alfred Rix, attorneys of this city, attending the examination on behalf of the plaintiff, and George Gifford, of New York, one of the ablest patent lawyers of the country, on behalf of the defendants. The depositions of nearly one hundred witnesses from Maine, New Hampshire, Vermont, Massachusetts, Canada, New York, Virginia, Pennsylvania, Michigan and other States, were taken. The trial of the case, in the presentation of the evidence and oral argument, occupied more than a month, to say nothing of the preparation and consideration of voluminous briefs, and the examination by the court of numerous precedents and authorities submitted.

These facts show the importance which the parties attach to the contest and the vigor and persistency with which they have carried it on.

The American Saw Company, it is supposed, has enlisted in its aid many of the other saw companies and firms in the East, which are alleged to be infringing the Spaulding patent. On the other hand, although Mr. Spaulding has shown himself to be an adversary not to be despised and amply able to protect his rights against the combined efforts of all infringers, and to meet the enemy in full force and at all points, yet, we are informed, there has been for some time past a company organized, awaiting the result of these suits, composed of some of our best business men of means and Eastern capitalists, for the purpose of starting an extensive saw manufacturing establishment in the East to work under the Spaulding patent and under his supervision.

These and other well known facts give the case a sort of public interest and justify more than a passing notice.

As an indication of Mr. Spaulding's purposes, principles and plan of action, we quote the following from his brief filed in the cases just decided:

"Taking warning as we do of the past history of valuable patents, we see before us a long, hotly contested litigation. We expect to meet in hostile array against us, what other patentees have had to contend with, the highest order of legal talent, employed experts, honest witnesses, who, with interested assistance of pirates and pirates' agents, have recalled from oblivion's grave a faint glimmer of long forgotten saw sockets which, from circular diagrams presented to the eye, and rounded corners incessantly described to the ear, have assumed the form of Spaulding's invention as they have slowly emerged from darkness, laid aside the ceremonies of their long hibernation, and reinstated themselves in a new form in men's memory; other witnesses also who have seen saw sockets in

years gone by, forgotten their forms, but believe and swear they are round because so many persons tell them so, not supposing they are telling anything false, except only in the one thing of saying they remember, when in fact they do not; other witnesses, again, who swear from motives that are all bad. These, and all else that unlimited capital and the ability of all kinds which it can command, we expect to meet. Whenever we believe our patent invalid we will cease the fight. But so long as we believe, as we now do, that the patent is a valid and good one, we propose to arm ourselves with truth alone, and continue the contest to the final end. Believing, as we do, that falsehood and its kindred allies can never form plans and combinations which can successfully contend against truth and energy, we prefer to cast aside, in every instance, every apparent advantage which falsehood may offer, firmly believing that however profitable such apparent advantages may seem to be at the time, yet that there is a principle of right working deeper and beyond the depth and range of human foresight that ever will bring a disastrous reaction to all advantages based upon a false foundation, temporary as they must always be."

The defendants in these suits produced witnesses who testified to some ten different instances of alleged prior use.

All of them, however, were placed from twenty to over thirty years ago; that is, there was no evidence to show, and it was not claimed, that the invention had been in use for more than ten years next prior to Spaulding's production of it in 1860.

The proof in support of all these instances depended upon a memory of from twenty to thirty years alone. No other corroborating circumstance, fact, or thing, was produced.

In several of these instances the testimony went to show that a large number of saws had been made, sold and used on Spaulding's plan, so that, if the defendants' testimony was correct, nearly a hundred saws like Spaulding's were made and used between 1830 and 1844, and yet not one single saw was produced on the trial. But, on the other hand, various drawings, patterns, teeth, and whole saws, were produced by the plaintiff, made and owned by the defendants' witnesses during the period in question, which were made on the old style.

They also admitted that although the new style was more easily made and better when made than the old, yet after trying the new and coming to this conclusion, they left off making the new or round sockets and went on with the old or square sockets. The great superiority of the Spaulding method was fully shown by all the testimony on the subject. Counsel for the defendants admitted that it was obviously the best mode of inserting teeth.

It was also shown and admitted that immediately on Spaulding's bringing out his saw, it became a success and went rapidly into general use, partly under his patent and partly in defiance of it. Some mill-owners testified that they were obliged to adopt the Spaulding saw in order to manufacture lumber as cheaply as the other mill-owners already using it.

These facts, together with many others of a like character, and many circumstances not necessary to mention here, along with the testimony of plaintiff's witnesses superior in numbers and of unquestioned veracity and intelligence, who testified in direct contradiction to those of the defendants, the Court found for the plaintiff, and the decision seems to be universally commended.

On almost every leading patent case, involving as this did the question of priority of invention, the public history of the art affords the public an almost certain means of arriving at the proper conclusion, and it seldom happens that its judgments, though half instinctive, are wrong.

In all this saw litigation Spaulding has been successful.

He commenced his first action, which was a suit at law, about two years and a half ago, against William Tucker, the agent of

the American Saw Company. The American Saw Company defended the suit, employed the best of legal talent here and in New York, and caused to be searched the models and records of the Patent Office and other sources of mechanical knowledge, in the attempt to find something of older date than Spaulding's patent, which would prove that his device (that of rounding the sockets to prevent the saw-plate from cracking) had been known and used before. They found a rotary mortising machine, which they put in evidence, and in addition to that tried to show that the third saw, which was made by Spaulding himself for a Mr. Soruberger, was Soruberger's invention and not Spaulding's.

The jury on that trial, Judge Deady presiding, decided for Spaulding, and judgment was entered for him for two thousand dollars damages with costs of suit added.

Within a few days after the termination of that action the cases just decided, which were chancery suits, were commenced and preliminary injunctions were granted by Judge Hoffman, then presiding in the Circuit Courts, enjoining the defendants in each of the suits from using or dealing in inserted tooth saws having rounded sockets. On account of these injunctions coming so quickly upon him after the judgment against him for damages in the former suit the defendant, Tucker, had only time to sell ten saws, and the decree against him could only be for the profit upon the sale of those ten saws, which, as compared with the value of the patent, was inconsiderable. The defendants in the other two suits infringed the patent by using the saws in cutting lumber in their sawmills, and not by dealing in the saws as merchants. The amount of their damages was not definitely fixed, but the Court holds that they must account to the plaintiff for what they have saved in their business by the unlawful use of his invention, and also decides that the evidence shows such saving to be not less than one dollar per thousand feet for all the lumber cut with saws which infringed the plaintiff's patent. The prosecution in all of these cases was against the saws known as the Emerson or American Saw Company's saws.

The defendants in these cases made herculean efforts to find something which might be decided to be an anticipation of Spaulding's patent. Several witnesses testified that money was offered to them to testify for defendants and to refuse to tell the truth for the plaintiff. Large rewards were also offered for the production of an old saw with rounded sockets.

We make the following other quotation from the plaintiff's brief, as it coincides with our views of the history of inventions and inventors:

"It is very unfortunate for inventors that every valuable invention is seized upon by pirates who appropriate to their own use the inventor's discovery. Instead of being willing to compensate him for making the discovery, of which the infringers avail themselves, they too often marshal themselves in combined array against the poor discoverer, seize his property, and hunt him with lawyers, experts, witnesses with easy consciences and elastic memories, and scientific egotists, as though he was an enemy of mankind instead of its benefactor. The contest waged by pirates is based upon no higher motives than the miser's avarice and the thief's dishonesty. From these passions, excited by the sight of gains acquired by infringement and the efforts to retain them, are born their odious but natural offspring—hatred and malice towards their victim—and this family of sin, as history shows, have often persecuted and dogged into his very grave the poor inventor, who with no faults but doing only right, and actuated by good motives only, had by his invention added to the world's advancement and mankind's good."

Whitney, the inventor of the cotton-gin, was sworn entirely out of it, but the world has pronounced the evidence by which it was done to be perjury. The same defence was set up against Morse's telegraph, Woodworth's planing machine, Goodyear's vulcanized rubber, and the whole

host of inventions which have advanced the world to its present position. In every instance men were found who swore they had seen the same thing before, and experts have always helped to establish a false appearance of identity of the old with the new.

Mr. Justice Grier, for so many years a Justice of the Supreme Court of the United States, and acknowledged generally to have been the greatest and ablest jurist that ever presided at the trial of patent cases, or gave construction to patent law, towards the end of a long life, much of which had been spent in trying patent cases, in the case of *Goodyear vs. Day*, uttered the following language as showing his convictions of the general injustice done to inventors after so long an experience.

"It is when speculation has been reduced to practice, when experiment has resulted in discovery, and when that discovery has been perfected by patient and continued experiments, when some new compound, art, manufacture or machine, has been thus produced, which is useful to the public, that the party making it becomes a public benefactor and entitled to a patent; and yet when genius and patient perseverance have at length succeeded, in spite of sneers and scoffs, in perfecting some valuable invention or discovery, how seldom is it followed by reward. Envy robs him of the honor, while speculators, swindlers and pirates rob him of the profits. Every unsuccessful experimenter who did or did not come very near making the discovery, now claims it. Every one who can invent an improvement or vary its form, claims a right to pirate the original discovery. We need not summon Morse or Blanchard or Woodworth to prove that this is the usual history of every great discovery or invention. The present case adds another chapter to this long and uniform history."

M. A. Wheaton and Alfred Rix, were the attorneys for plaintiff, and Messrs. McAllister and Bergin were attorneys for the defendants.

Visit from the Commissioner of Agriculture.

While at the Bureau of Agriculture in Washington, recently, we were pleased to learn that the Commissioner of that Department, Hon. Horace Capron, intends visiting California, and probably Oregon and other parts of the Pacific coast, during July or August of this season. He will be accompanied by the better half of his household, and we believe will make us quite a stay, and one which will result in much benefit to our coast, and the cause of agriculture at large. We hope soon to announce more particularly the time of his coming. In the meantime, we hope our agricultural friends will prepare to give him a hearty welcome, and all the assistance and information possible in furtherance of the objects of his visit. He will be here in just the season to attend our various State and District Agricultural Fairs, and the Grand Industrial Exhibition which will come off in this city under the auspices of the Mechanics' Institute.

RAILROAD BUILDING FORTY YEARS AGO.

Less than forty years ago the Boston Courier, then one of the leading papers in New England, contained the following editorial notice of the project then entertained of connecting Boston and Albany by a railroad:—"Alcibiades, or some other great man of antiquity, it is said, cut off his dog's tail that *quid nunc* might not be extinct from want of excitement. Some such motive, we doubt not, has moved one or two of our natural and experienced philosophers to get up the project of a railroad from Boston to Albany,—a project which every one who knows the simplest rule in arithmetic knows to be impracticable, but at an expense little less than the market value of the whole territory of Massachusetts; and which, if practicable, every person of common sense knows, would be as useless as a railroad from Boston to the moon."

DOMESTIC ECONOMY.

Importance of Scientific Knowledge to Housekeepers.

Not many years have passed since the science of housekeeping began to be talked about. Until recently, how the idea of a housekeeper—a woman needing scientific knowledge would have been scouted! Yet the labors of her life have been a series of philosophical and chemical experiments; though for want of the requisite knowledge, frequently imperfect, sometimes unsuccessful, occasionally disastrous. The violation of laws and principles of which she knew nothing, has not only caused great vexation, loss and disappointment, but endangered house and furniture; destroyed life, even. Ignorance of chemical affinities and combinations has produced unnumbered woes in the household, and will continue to do so until women receive an education suited to their varied and numerous duties.

Wives and mothers do not often knowingly murder their husbands and children; yet how many die of slow poison administered, unsuspectingly, in their food! Sometimes whole families are killed outright, shocking the whole community, and teaching them at a fearful cost a simple lesson, which should have been taught them at school in their childhood.

A family in Pennsylvania were poisoned by eating peaches dried on boards painted white. Another family experienced fatal results from partaking of pie plant put up in tin cans. Beans baked in earthen pots, the glazing of which contains lead, have produced death. Some bake beans in brass kettles, which give them a greenish tinge—too suggestive of poison, one would suppose, to admit of their being highly relished.

A number of students in New Haven were poisoned by eating corned beef hoiled in a copper kettle, the oxide of copper being found in considerable quantity among the meat. A lady was taken frightfully ill after dinner, and the physician, on investigation, found she had partaken of a dish prepared with vinegar, in which a German silver spoon had been left.

It makes one shudder to think of our grandmothers "greening" their pickles in brass or copper kettles; a method which in this enlightened age it is presumed no longer exists.

The practice of hoiling cider in brass kettles is seriously objected to by many; and it is to be desired that some better way may be devised, but as the oxide is produced only at the point of contact with the metal, if not allowed to stand in the kettle, no very deleterious effects will be produced.

Very distressing results have followed the eating of chicken pies, in which no aperture was made in the upper crust. To insure safety a piece of the crust should be removed from the center of the pie.

These are some of the more serious consequences resulting from ignorance of scientific principles. I may, in another article, speak of the minor evils attending a want of this important knowledge.—*The Household.*

How to Collect Odors of Flowers.

A fair floriculturist writes that those persons who would secure for themselves genuine odors of flowers, and at the same time pleasantly employ themselves, may do so in the following manner: Roses, and all flowers containing oils—and most highly perfumed flowers contain a quantity of oil—may be made to yield their aromatic properties by steeping the petals or flower leaves in a saucer or a flat dish of water and setting it in the sun. The petals should be entirely covered with the water, which, by the way, should be soft—rain water would be the best. A sufficient quantity should be allowed for evaporation, and the vessel should be left undisturbed a few days. At the end of this time a film will be found floating on the top. This is the essential oil of the flower, and every particle of it is impregnated with the odor peculiar to the flower. It should be taken up carefully and put in tiny vials, which should be allowed to remain open till all watery particles are evaporated. A very small portion of this will perfume glove-boxes, drawers, apparel, etc., and will last a long time. The odor of musk blossoms is one of the most lasting, as well as the most pungent of floral scents, and is more delicate than, though not so lasting, as the animal product musk.

Boiled Wheat.

It is possibly not as well understood as it should be, among housekeepers, that a healthful and nutritive food may be prepared by hoiling wheat, to be eaten with milk or molasses—the former to be preferred when attainable. It is a first-rate thing for children, while adults may use it to advantage. Some have the wheat cracked in a mill before using, which is perhaps the preferable plan, but it will answer well without this preparation. A lady correspondent of the *Ohio Farmer* says:—"The wheat should be cracked in a mill. Take one quart and put it into half a pot of warm water, and let it stand upon the stove several hours; then boil slowly, and stir it occasionally, till it becomes thick; put in a handful of salt. For children it can be used with milk. If left standing till cool, it is very nice to cut in slices and use with cream and sugar, or fry it like mush; the last mentioned I prefer for general use, but it can be prepared in various ways."

If hoiled whole the wheat should be allowed to soak in tepid water before hoiling, that the grain may have a chance to soften and swell. When properly hoiled use with milk suitably seasoned with salt and pepper, and it will be found a nourishing, healthful and palatable dish.

Purification of Lard.

Take twenty-eight pounds of perfectly fresh lard; place it in a well-glazed vessel that can be submitted to the heat of a hoiling salt-water bath, or of steam under a slight pressure. When the lard is melted, add to it one ounce of powdered alum and two ounces of table salt. Maintain the heat for some time—in fact, till a scum rises, consisting in a great measure of coagulated proteine compounds, membrano, etc., which must be skimmed off. When the liquid grease appears of a uniform nature it is allowed to cool. The lard is then washed. This is done in small quantities at a time, and is a work of much labor; which, however, is amply repaid by the result. About one pound of grease is placed on a slate slab, a little on the incline, a supply of good water being set to trickle over it. The surface of the grease is then constantly renewed by an operative working a muller over it, precisely as a color-maker grinds paint in oil. In this way the water removes any traces of alum or soap; also the last traces of nitrogenous matter. Finally, the grease, when the whole is washed in this way, is remelted, the heat being maintained sufficiently to throw off any adhering water. When cold, the operation is finished.—*Druggists' Circular.*

Dinner Time.

Dinner time should be at noon, as to the great masses of society. An unfortunate necessity may impel some business men in large cities to take dinners late in the afternoon, and some may follow the practice with apparent impunity, but the risk and responsibility are their own, and there it is left at least for the present. As a common thing persons cannot take into the stomach more food than will last six or seven hours; if more is taken, it cannot be acted upon to advantage by the stomach, nor can the person work well.

Ordinary labor exhausts the strength contained in a common meal in the time specified. Persons may habituate themselves to eat more and work; but taking everything into account, families, consisting of old and young, of strong and weak, of robust and the sickly, will find it most convenient, as an average, to eat at about six hours interval; and this, with an early breakfast, brings the dinner at noon.

The work since morning whets up the appetite for dinner; the work after dinner grinds up the food, manipulates it in such a manner as to enable the body not only to obtain from it the power to work in the afternoon, but to give something of a surplus, to answer the wants of the system during the night, in connection with a light supper. Hence, the world over, the noon dinner is the great meal of the day; it supplies the wastes of the forenoon's work, and as just said, gives the power to labor through the afternoon.

WASHING FLANNELS.—A correspondent writes to the editor of the *Household* as follows: "I notice among the hints to housekeepers that flannels should always be washed in hot water and scalded to prevent shrinking. This is exactly contrary to my method, and my flannels never shrink, but grow thinner until worn out. I always wash them in lukewarm water, rubbing on as much soap as is necessary, then rinse in cold water."

Domestic Receipts.

FARMER'S PUDDING.—Take one pint of bread crumbs, one quart of milk, half a cup of sugar, four eggs, taking only the yolks, butter the size of a walnut, one lemon, grated; bake until done, but not watery; then spread a layer of currant jelly or any preserved fruit over it. Take the whites of the eggs and sugar, in which has been stirred the juice of the lemon, heat to a stiff froth, pour it over the pudding and brown it. Serve cold with cream. It can be made without a lemon. Flavor with nutmeg.

MOCK VENISON OF CORNED BEEF.—Cut the beef in thin slices, and freshen by soaking for three or four hours in tepid water. When sufficiently fresh, lay the slices on a gridiron, and heat through quickly. Make a gravy of drawn butter; add a little pepper, and the yolk of an egg chopped fine, and pour over the meat; or butter, pepper and salt, like beefsteak. This will be found a savory dish when only salt meat can be procured, but it is better with fresh beef.

TOMATO SOUP.—Take any cold meat; hoil well with cabbage and other vegetable; pepper and salt; then add your tomatoes.

CRAB SOUP.—One dozen crabs picked, putting aside the white fat, to as much boiling water as will fill your tureen; add the meat just before dinner; throw in a little bunch of parsley, (but take it out again) pepper, salt, and a moderate-sized piece of butter, with a little flour to give consistency.

DAMASUS BISCUIT.—Beat the whites of the eggs to a froth, chop the suet and almonds separately very fine, and heat well together; mix with the yolks of the eggs, the loaf sugar finely sifted; heat well, and pour into the almond mixture; shake in the flour, and add to flavor of peach; bake in small time.

ABERNETHY BISCUIT.—Mix sugar, butter, milk, eggs and caraway seed as usual for baked rolls, cut out in any shape, bake in a moderate oven.

TO REMOVE MILDEW FROM CLOTHING.—I saw an inquiry how to remove mildew from clothing. Here is my way:—Take a handful of salt, half a cupful of soft soap, rub on the cloth exposed to the sun. It will come out with one or two bleaching.—*Ex.*

Mechanical Hints.

MOISTURE IN WOODS.—According to Dr. Larsig's experiment, woods (trees) generally contain, during the winter months, an average of 50.7 per cent. of moisture; in March and April, about 45.9 per cent; in May, June and July, about 48 per cent; while up to the end of November the quantity of moisture increases but little. Air-dried wood (lumber) contains from 20 to 25 per cent. of water, and never less than 10 per cent.—wood which, by being artificially dried, has been deprived of all moisture is thereby entirely altered as regards its cohesive length—it becomes brittle, loses its elasticity and flexibility.

HOW TO MAKE A BRICK OVEN.—Many a house-keeper, especially a farmer's wife, longs for a good old-fashioned brick oven, especially when there are several loaves of bread and a dozen pumpkin pies to bake at once.

A brick oven built in the old style, out of doors, entirely separated from the dwelling house, is more safe, so far as danger from fire is concerned, than if built by the side of the fire-place in the house. A good brick oven for baking bread, pies and cakes is worth all the ranges and cook stoves that one could store in his kitchen. In such an oven everything will be baked just right, above and below, through and through.

After the foundation has been prepared, let two courses of hard bricks be laid for the bottom of the oven. Then build the mouth and part of the sides, until it is desirable to begin to draw the sides inward, when sand or mellow earth may be placed on the foundation and the surface smoothed off and pressed down to the desired form of the oven. Now let the brick-work be built, over this form of sand. Let two courses of hard brick be laid over the form with the best mortar. After the last brick is laid, the sand may be removed.

The bricks should be soaked for several hours in water, previous to being laid, so they will not absorb the moisture of the mortar until it has set. Such an oven will cost but a few dollars. Many people can collect a sufficient number of loose bricks and pieces around their dwellings to build an oven. Besides this, through only half a mechanic, one can build such an oven about as well as a mason.—*Manufacturer and Builder.*

Miscellaneous.

Of a far Higher Class than any other proprietary
medicine of the day stands

Tarrant's Effervescent Seltzer Aperient.
And for this reason: it is an exact counterpart of one of
the most valuable medicines in the world. We refer to
the great Seltzer Spring of Germany, to which thousands
of the dyspeptic, the bilious, the rheumatic, and the
victims of venal diseases resort annually, and return to
their homes convalescent or cured. The Aperient is
one of the first, and by far the most successful, of all
the efforts made to reproduce, in a portable form, the
popular mineral waters of Europe. SEE THAT YOU
PURCHASE ONLY THE GENUINE ARTICLE.
SOLD BY ALL DRUGGISTS.

STEAM JET PUMP.
Blakeslee & Williams' Patent.—For
Water, Oils, Acids, Etc.

The best COLD WATER
PUMP for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saves the ex-
pense of putting up and
running an engine.
We ask the attention of
all proprietors of steam
power to the following
points of merit.—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it op-
erates entirely independent of an engine; it will not choke
up with foul water; it costs much less to put up and
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.
Satisfaction guaranteed or the money refunded.
Send for Circular. PARKER & HUNT,
Southeast cor. Tenth & K Streets, Sacramento City Cal.

The "PAIN KILLER" may justly be styled the great medicine of the world, for there is no region of the globe into which it has not found its way, and been largely used and highly prized. Moreover, there is no clime to which it has not proved to be well adapted for the cure of a considerable variety of diseases; it is a speedy and safe remedy for burns, scalds, cuts, bruises, wounds and various other injuries, as well as for dysentery, diarrhea, and bowel complaints generally, it is admirably suited for every race of men on the face of the globe.

It is a very significant fact, that notwithstanding the long period of years that the "Pain Killer" has been before the world, it has never lost one whit of its popularity, but on the contrary, the call for it has steadily increased from its first discovery, and at no previous time has the demand for it been so great, or the quantity made so large, as it is to-day. Another significant fact is, that nowhere has the Pain Killer ever been in higher repute, or been more generally used by families and individuals, than it has been here at home, where it was first discovered and introduced. That the Pain Killer will continue to be, what we have styled it, THE GREAT MEDICINE OF THE WORLD, there cannot be the shadow of a doubt.—Providence Advertiser.

THE PATENT
Novelty Mill and Grain Separator

Is one of the greatest improvements of this age for cleaning and separating Grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

Altona Gravel Mining Company—Location

of Works, Gress Valley, Nevada County, California.
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the twenty-third day of May, 1871, an assessment (No. 2) of twenty-five cents per share was levied upon the capital stock of said company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, No. 23 Merchants' Exchange, San Francisco.

Any stock upon which said assessment shall remain unpaid on Monday, the twenty-sixth day of June, 1871, will be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the seventh day of July, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale. By order of the Board of Trustees. DAVID WILDER, Secretary, Office, No. 23 Merchants' Exchange, California street, San Francisco, Cal. 21v22-1m

Altona Number One Gravel Mining Company.

Alta Hill, Gress Valley, Cal.
The first annual meeting of the stockholders in the above named Company will be held at their office, No. 28 Merchants' Exchange, San Francisco, on Thursday, July 6th, 1871, at 2 o'clock p. m., for the election of Trustees, and the transaction of other business. By order of the President. DAVID WILDER, Secretary, jun15-5w

Eagle Quicksilver Mining Company—Location

of Works, Santa Barbara County, California.
Notice is hereby given, that at a meeting of the Board of Trustees of said company, held on the 14th day of June 1871, an assessment of twenty dollars per share was levied upon the mines of said company, payable immediately in gold coin of the United States, to the Secretary, at his office, Room No. 5, No. 302 Montgomery street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Wednesday, the 3rd day of August, 1871, shall be deemed delinquent, and will be duly advertised August 12th, 1871, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 14th day of August, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. WM. H. WATSON, Secretary, Office, Room 5, No. 302 Montgomery street, San Francisco, California.

BERRY & PLACE,
Importers and Dealers in
MACHINERY AND SUPPLIES.

SAN FRANCISCO, CAL.

Sole Agents in Pacific States for Sale of

Blake's Patent Steam Pumps,
Smith's Wood-Working Machinery,
Davis & Furber's Woolen Machinery,
The Swain Turbine Water Wheel,
Wood, Light & Co.'s Machinists' Tools,
Sturtevant's Pressure Blowers,
Hardy's Portable Drillers,
Dreyfus' Patent Self-Oilers,
Gardner's Safety Stop Governor,
Page's Belting, Etc., Etc.

We keep in stock the above, with a large variety of other Machinery and Small Tools.

Dreyfus' Patent Self-Oilers and Cylinder Cups.

A saving in oil of 75 to 95 per cent. guaranteed. No trouble of "oiling up!" No waste of oil! No oil cans needed!

by the use of the

NATHAN & DREYFUS

SELF OILERS.

These Oil Cups are too well known to require any lengthy description; the following are the main points of advantage.

We guarantee a saving of

75 PER CENT OF OIL.

They are composed of a transparent Glass Cap, mounted in Brass, provided with a hollow tube, inside of which is placed a loose acting solid or hollow wire, which acts as a Feeder and Regulator. The wire rests constantly upon the Journal, thereby acting with the bearing in its motion. The wire is so regulated inside the tube as to feed according to the demand only. There is no flow of oil whatever while the machinery is not in motion.

They are as reliable in Winter as in Summer.
Being a perfectly air tight vessel, the oil will never gum in them, as this has been proven by four years' constant use.

They are constructed in a very neat and substantial manner.

We spare no pains in making them as perfect as it is possible for them to be made, and guarantee them to give perfect and entire satisfaction.

No testimonials are printed, but ask any one who has them what they think of them. Be sure you get Dreyfus'. Send for Circular and Price List to BERRY & PLACE, San Francisco.

GARDNER & ROBERTSON AUTOMATIC SAFETY STOP GOVERNOR.

After an experience of eleven years in the manufacture of the above Governor, during which time several important improvements have been made and two additional patents obtained we feel justified in recommending it to all parties using steam power, and warranting it to be the most perfect regulator in the market.

The Gardner Governor is so well known that we think it unnecessary to enter into a detailed explanation of the principles involved, or details in its construction, merely giving the leading objects realized by this important invention. The Governor combines with the greatest simplicity of construction, accurate regulation of speed, positive insurance against all accidents liable to occur from slipping or parting the Governor or driving belts, and a convenient arrangement for adjusting the speed of the Engine while in motion, without change of pulleys.

The construction of the Governor is extremely simple, having no springs, inside joints, ewels or parts liable to disarrangement, all the several parts are duplicates of each other in the same series; the most skillful workmen are employed, the best material used and the machinery employed especially adapted to their manufacture. Thus we warrant these Governors to give perfect regulation of speed under all circumstances, and we will cheerfully refund the money, after a trial if not satisfactory. We keep a large assortment on hand.

When ordering, be particular to say Governor with THROTTLE VALVE or WITHOUT THROTTLE VALVE; and either BLACK or FINISHED, as you may require. Send for Price List to BERRY & PLACE, San Francisco.

Nathan & Dreyfus Automatic Cylinder Lubricator.

In introducing this valuable Cup to the public, we desire to call very particular attention to its many special advantages: First—Nothing but clean oil or tallow is admitted into the Cylinder; no lime or sediment of any kind. Second—Its great economy of both tallow and fuel. Third—It is self acting, and supplies the lubricating material only while the Engine is in motion. Fourth—Its certainty and regularity of feeding, and increase of the power of the Engine.

The principle upon which this apparatus is founded is that, instead of admitting tallow into the Cylinder in considerable quantities at uncertain intervals by means of tallow cups, grease cups, and other crude contrivances, and allowing it to be in fact blown out at the exhaust (as must necessarily be the case), this Cup, by its peculiar action, delivers the lubricant in drops into the body of the steam, which thereby becomes thoroughly impregnated or greased before passing into the steam chest or Cylinder; the consequence is, that instead of falling to the bottom of the Cylinder, as it does when admitted through a tallow cup (which passes the lubricant from the bottom of the Cup to the Cylinder), it enters into the form of minute globules, and hence the whole of the internal parts of the engine become regularly and constantly greased. The result of its action has been proved in a very great number of cases to be an enormous saving of tallow, a considerable increase in the power of the engine, a great saving in fuel, and reduction of internal friction to a minimum.

These Lubricators will save you 75 per cent. of the Lubricating Material, and cost no more than the common Compression Cups.

For further information, or Price Lists, address BERRY & PLACE, Importers Machinery and Mill Supplies, Warerooms, 112 and 114 California street, San Francisco.

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchasers shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

by the cry of "Humbag," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN H. WILSON,
San Francisco.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, COR. Mission & Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. O is a valve, connecting with cup which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before re-charging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the injection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C.

MILLER'S TRUSSED PLATFORMS,
COMPRESSION BUFFERS AND AUTOMATIC COUPLERS, FOR RAILROAD CARS.

PATENTED MARCH 31, 1863, JANUARY 31, 1865, AND JULY 24, 1866.

Office—No. 231 Broadway, Rooms 4 and 5, opposite City Hall Park, New York.

The advantages gained by the use of these improvements may be briefly stated as follows:

- 1st. The platforms are held in a plane with the sills on the cars.
- 2d. The platforms cannot be broken by any ordinary accident.
- 3d. Telescoping is impossible.
- 4th. Any required compression may be attained, to prevent accidents by oscillation.
- 5th. No links and Pins are required, and no one is required to go between cars to couple them.
- 6th. The platforms may be held as close together as desired.
- 7th. By close coupling the train is shortened.
- 8th. They will not accidentally uncouple.
- 9th. They may be uncoupled "without shutting off," to make a flying switch.
- 10th. They are strong; the train will not "break in two" at starting or while running.
- 11th. They cause the train to move steadily and not jerk in starting or stopping.
- 12th. They work well at great variations of height.
- 13th. They will couple with all kinds of "drawheads" and "couplers."
- 14th. They are cheap and durable.
- 15th. Injury to men when coupling cars is entirely prevented.
- 16th. Injury to persons by falling between cars is entirely prevented.
- 17th. Injury to persons and to cars by "telescoping" is entirely prevented.
- 18th. Injury to persons and to cars by "oscillation" is entirely prevented.
- 19th. The great steadiness of the cars, produced by compression, renders sleeping cars much more desirable.
- 20th. "Train Brakes" are rendered more valuable by the non-existence of "slack" in the train.

No Railroad Manager who comprehends the case fails to give these improvements a "trial," and all those who have tried them have adopted them.

Prices of Materials, Etc.

Coupling Hooks.....	\$24 50 each.
Buffers.....	11 00 each.
Levers.....	2 00 each.
Patterns in Full Sets, or Single Pieces, for all castings used in the Improvements; and Templates, for Wrought Irons, AT COST.	Drawings,

PACIFIC BRIDGE COMPANY,

OAKLAND, CAL.,

ARE PREPARED TO BUILD ALL KINDS OF WOODEN BRIDGES ON
SMITH'S PATENT TRUSS PLAN.

These Bridges have been thoroughly tested in the East for Three Years, and wherever tried have proved superior to any other Bridge in the following points:
Being built of wood entirely, they are not affected by change of temperature.
The timber used is placed so directly in the line of strain, that less material is required to support the same load.
It is not perceptibly affected by shrinkage. It is the most Economical Bridge built. It is adapted to any practicable LENGTH OF SPAN.
Plans, Specifications and Terms will be sent to any County, Township or Person wishing to build a Bridge, and no charge made unless the Plan is used. For all Public Bridges the Plan will always be open to competition.

KNOWLES' PATENT STEAM PUMP.

It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

The main steam valve of the Pump is not a rotary valve, but is an ordinary flat slide valve. The slight rotary motion given the valve-rod simply puts the valve in a position to be driven horizontally on its seat. This style of flat valve embodies the most favorable conditions for tightness possible, even after the wear consequent upon long use.

The steam cylinders are fitted with the most perfect spring ring packing, with screws and springs, for proper adjustment.

The water cylinders are fitted with composition heads and rings, adjustable by screws, or with leather rings or a patent fibrous head, according to the nature of the work required. All the joints are ground to fit, and require no packing. The glands and piston-rods are solid composition. The valve seats are composition, and the valves either rubber or metal, and are very durable, and are placed in the pump so as to be easily accessible, and in the larger sizes, for fire or marine purposes, are got at immediately without removing any nuts or bolts.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, Cal., April 14, 1871.

A. L. FISH, Esq., Agent of the Knowles' Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles' Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have sixteen of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other.

Yours truly,

A. J. STEVENS, General Master Mechanic.

OFFICE OF PEOPLE'S TRANSPORTATION CO., PORTLAND, Oregon, April 22, 1871.

Mr. A. L. FISH—Dear Sir: The No. 4 (Knowles & Selby's) Steam Pump arrived here safe and in good order for steamer Pacific. I am pleased with the new pattern and late improvements—it works splendidly. I consider them the best steam pump now in use. They are excellent and simple in construction, and do good work, and can always be relied upon. I can cheerfully recommend them, having used them constantly for nearly three years. I am fully satisfied that they are the cheapest and best Pump in use.

Yours respectfully,

G. MARSHALL, Chief Engineer.

OFFICE OF N. Y. CENTRAL R. R., ALBANY, June 3, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: Yours of 31st was received. We have in use on our road 18 of your Steam Pumps, seven of which are used for fire purposes and 11 at water stations. Most of them have been in use three years, and are giving us entire satisfaction.

Yours very truly,

C. P. HARM.

OFFICE OF DELAMATER IRON WORKS, NEW YORK, May 20, 1871.

Messrs. KNOWLES & SIBLEY, 92 Liberty street—Gentlemen: In reply to your inquiry as to my opinion of your Pump, I have to say, after an experience of ten years with these pumps on land and sea, if they have faults of any kind I have not been able to discover them.

Yours very truly

GEORGE M. REYNOLDS, Supt. Engineer.

U. S. NAVY YARD, NEW YORK, June 3, 1871.

Messrs. KNOWLES & SIBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully,

WM. W. WOOD.

OFFICE OF THE THOMAS IRON WORKS, HOKENDAUQUA, Pa., June 1, 1871.

Messrs. KNOWLES & SIBLEY—Gentlemen: After having tried steam pumps of a great many different makes without giving proper satisfaction, we finally got one of yours. The first pump of your make we had in use is now about eight years, and it has given such excellent satisfaction that we have since that time increased the number to thirty, which we have now in use and doing good work. The small size for feeding boilers I think excel anything as yet produced, and we have adopted them in preference to anything else. We have in use a number of your Mining Pumps, which to say the least are equal to the best we have tried. I cheerfully recommend "The Knowles Pump" to any who may have use for a first-rate Steam Pump.

Respectfully yours, etc.,

EDWIN MICKLEY, Supt. of Mines.

OFFICE OF THE SAUCON IRON CO., HELLERTOWN, Northampton County, Pa., May 26, 1871.

Messrs. KNOWLES & SIBLEY, New York—Gents: We can most cheerfully respond to your inquiry as to the qualities of the Knowles Patent Steam Pumps we have in use. We bought six of your Company, some of which have been running nearly five years and are now working as well as ever. We have them at the furnace and at the mines working in clear and muddy water, and have put them to severe tests. And we can say that they have given very great satisfaction, and that we like them better than any we have ever used.

Yours very respectfully,

G. W. WHITAKER, President and Superintendent.

OFFICE OF THE NEW HAVEN WATER CO., Dec. 18, 1869.

Messrs. KNOWLES & SIBLEY, New York—Gentlemen: During the drought of last summer we were under the necessity of putting in some kind of steam pump to assist our usual supply. We gave the preference to the pumps made by Messrs. Knowles & Sibley, and purchased one of 15-inch dia. steam cyls., 12-inch dia. water cyl., and 24-inch stroke. We ran it about two months, and the estimate quantity delivered into our reservoir was 1,000,000 gallons per 24 hours under a head of 125 feet. At an average consumption of coal of three tons per 24 hours (boilers), we consider the pumps as built by them the best in the market.

Yours very truly,

P. SAULT, Superintendent.

CENTRAL AND WESTERN PACIFIC AND OAL AND OREGON RAILROADS, OFFICE SUP. M. P. & M., SACRAMENTO, Cal., July 8, 1870.

A. L. FISH, Esq., San Francisco—Dear Sir: Your favor of the 3d inst. is received, asking my opinion in regard to the Knowles Steam Pump, and would say I have used the Knowles Steam Pump for several years, and consider them for all purposes the best steam pump in use. Yours truly, E. F. PERKINS, Supt. M. P. & M.

OFFICE OF RED BLUFF WATER WORKS, RED BLUFF, June 11, 1871.

A. L. FISH, San Francisco—Sir: The Knowles Pump we got from you has been working now four months, and has given entire satisfaction, and I take great pleasure in recommending them to be all you have claimed for them, and I will add that I think they have no equal. Yours, etc., JOHN OLEMENTS, Engineer.

WE BUILD AND HAVE CONSTANTLY ON HAND

THE LARGEST STOCK OF PUMPS IN THE WORLD.

And for Every Conceivable Purpose.

Universal Boring Machine.

In the SCIENTIFIC PRESS of October 15, 1870, was illustrated an excellent device,—a universal wood-working machine. The machine here illustrated is manufactured by the same firm, and is certainly a valuable addition to the many wood-working machines now in use.

A boring machine, though one of the simplest, is yet a most necessary adjunct to a full outfit of wood-working machines. The one here illustrated is most complete, and the great variety of work it is capable of performing, renders the name chosen for it peculiarly applicable. It is called the "Universal Boring Machine," because the most prominent feature of its construction is its power to bore a hole in any desired angle with the axis of the bit.

Any sized bit required is inserted into the chuck, which is adjustable to fit large and small shanks. The mandrel carrying the chuck is made to traverse by a foot lever so as to bore any depth up to 12 inches. The mandrel is driven by belt from a cone pulley of three faces, which gives the proper speeds for different sized bits.

Slots and stops upon the table enable the work to be set at any desired angle on the horizontal plane, while the table can be set on an incline to any angle not exceeding 45°. The table is 21 in. wide, with 15 in. slide, and it can be raised or lowered 15 in.

The countershaft rests in self-adjusting boxes, and has a tight and a loose pulley eight inches in diameter. The traversing mandrel is of the best quality of steel, and the machine is otherwise made of iron in a substantial manner. The several adjustments enable the operator to do all kinds of boring, with ease and rapidity.

This machine was awarded the first premium at the Cincinnati Industrial Exposition in October, 1870. Already one at least has been sent to our coast (to Portland, Oregon), to our knowledge, and more may have been sent of which we have no information. But we have no doubt but that many will be found necessary on this slope. It is manufactured by McBeth, Bentel & Margedant, of Hamilton, Ohio, who may be addressed for machines, rights to manufacture, or other information.

UNION AND NORTHERN PACIFIC RAILROAD.—The Omaha Herald, of June 20th, says that on June 19th a party of surveyors left Omaha to run a line from Evanston, on the U. P. R. R., through the valley of the Bear river, north and northwest, via Soda Springs and Snake river, to Helena and Virginia City, Montana, to tap the N. P. R. R.

A Remarkable Plant from Nevada.

At a late meeting of the California Academy of Sciences, Dr. Blake presented some specimens of *Phycochromaceae* of *Algae* which, in an excursion into Nevada, he had found

Growing in a Hot Spring

In the Penabla valley. The temperature of the spring he believed to be about 140° to 150°, but having no thermometer, this could not be ascertained with accuracy. These *Algae* consist of delicate hair-like

older seas where the temperature of the water must have been far higher than it is at present. Many diatoms were found associated with these *algae*, the forms of which were considered to be more closely related to those found in infusorial earth than to the diatoms of our colder waters. This point, however, was reserved for further investigation.

Academy of Sciences.

A meeting of the Academy was held on

McBETH, BENTEL & MARGEDANT'S UNIVERSAL BORING MACHINE.

cells, and probably constitute the smallest vegetable known. With a magnifying power of 700 diameters they still appear no larger than a hair, and approximately measured about 1-70,000th of an inch. They belong probably to the *Spirulina* and *Oscillaria*.

The most marked peculiarity of these plants is the extraordinary places in which they grow. They are found not only in hot saline springs, but in chemical solutions of the most poisonous substances, as arsenical solutions, which would be fatal to every other form of vegetable and animal life. They are the lowest forms of organized beings, developing no spores, but multiplying by simple division. Their growth in hot saline solutions renders it probable that they were the

Earliest Form of Vegetable Life
On the globe, as they would grow in the

Monday evening to complete the organization by the election of the necessary officers.

Officers.

The following is a complete list of the officers of the Society: President, Dr. James Blake; Vice-President, Prof. George Davidson, U. S. Coast Survey; Cor. Secretary, Dr. J. G. Cooper; Rec. Secretary, A. D. Hodges, Jr.; Treasurer, Elisha Brooks; Librarian, S. L. A. Brannan; Director of Museum, H. G. Bloomer.

The Board of Trustees is now constituted as follows: The President, Recording Secretary and Treasurer (as above) *ex officio*; Dr. C. M. Hitchcock, Gen. John Hewston, F. L. A. Pioche and Samuel Hubbard.

The next meeting will be held Monday evening, July 3d.

Eastern Visitors to Our State Fair.

The number of visitors from the Eastern States to our State Fair this fall is likely to be very large. Numerous inquiries are being made of the Secretary of the Board of Agriculture in regard to a reduction of fare on the railroads for such visitors. Upon application to the officers of the Central Pacific road, they have authorized the publication of the following liberal terms of rates of fare from Omaha to Sacramento and return. In companies of twenty-five, the round trip will be \$170 each. In companies of fifty, the round trip will be \$130 each. In companies of any larger number, the prices will be reduced in the same ratio. Applications for tickets for such excursions upon the above named terms to be made at the office of the railroad at Omaha. The above rates will be payable in currency. All articles or animals to be exhibited at the State Fair the Central Pacific Road will transport to and from the Fair free of charge. These terms will enable the people in the States and Territories east of the Rocky Mountains to be represented both as to themselves and their products at our Fair with but little expense, and we shall expect to see a large representation.

It stands our own people in hand to see that the reputation of California is fully maintained by a full exhibition of the products of all her industries. Many portions of the State, on account of the drought, will necessarily be unable to make a good show of the cereals, but other portions can do so, and, under the circumstances, they should not fail to do it.

To the Apprentices of California.

The board of managers of the Eighth Industrial Exhibition, desiring to encourage and advance

the interests of the Mechanical Apprentices, will, at the incoming Exhibition, award special prizes for the best specimens of drawing, designs, models, or mechanical workmanship, and space will be allotted to this department. The class and value of premiums, to be awarded on the merit of the exhibit, by a Committee appointed by the Board of Managers.

Each exhibit must have attached the name and age and residence of exhibitor; and an application to exhibit in this Department must be accompanied with a voucher from the employer, that the exhibit is the sole work of the exhibitor.

Information will be furnished and applications for space may be made to J. H. Gilmore, Special Agent Eighth Industrial Exhibition at the Mechanics Institute, 27 Post street, San Francisco.

MECHANICAL PROGRESS.

SCREW-BOLT MAKING IN CHICAGO.—The *Railway Review*, for June 15th, describes the establishment of the Union Screw-Bolt Company. We quote in reference to the patented machine for threading the blanks:—"Two flat steel disks of the same size (varying in size and strength with the work to be done, but generally about five inches in diameter) revolve rapidly in opposite directions in a vertical plane; and, when idle, run far enough apart to receive between their faces the rod to be threaded. These disks take the place of the "plates" in all other contrivances. They have sharply defined thread dies raised from their planes near their outer edges, and facing each other. These raised threads are not more than four or five in number, and are just as far apart as the desired thread is to be. They form a spiral, clean-cut, raised edge, commencing inwards a little ways from the extreme outer edge and traveling outward (more or less rapidly, according to the number of threads to the inch), finally terminating at the periphery. Between these revolving disks the blank rod is introduced, point foremost, as far as the thread is desired to extend up the rod, and is left free to turn with the disks, which are then, by means of a powerful lever, brought as near together as the rod allows, and made to hear upon opposite sides of it. The rod at once takes a rapid revolving motion from them, and commences traveling outward. When the point is reached it drops on to an apron a perfectly threaded bolt. With this machine a boy will make on an average 8,000 three-quarter inch bolts per day. The rod may be wrought hot or cold, though when over three-fourths or seven-eighths of an inch in diameter, it is preferable to heat it." It will be seen that the thread is not cut, but impressed; thus toughening, instead of weakening, the rod.

BESSEMER METAL MANUFACTURE IN THE UNITED STATES.—"There are now nine establishments in the United States which will give their quota of Bessemer metal rails to supply the constantly increasing needs of our railways. Of these one is located at Troy, N. Y.; four in Pennsylvania, respectively at Harrisburg, Lewistown, Bethlehem, and Johnstown; two in Chicago, Ill., and another at Joliet, in the same State; and one at Cleveland, Ohio. Only three of these were running in 1870. They turned out about fifty thousand tons of steel rails. It is hoped that the whole number being in operation the present year will give a production fifty per cent. greater than that of last; while there are those sanguine enough to predict that, should present inducements to the manufacture continue, the year 1872 will witness a yield of one hundred and fifty thousand tons. Already ten millions of dollars have been invested in American Bessemer works, and the result of the increased product is seen in the reduction of the price from two hundred dollars per ton in 1862 to one hundred and five dollars per ton in 1871."—*Artisan*.

ELECTRO-MAGNETIC BOILER-SCALE PREVENTOR.—We mentioned this some time since. It seems to be a success. The *Railroad Gazette* says: "The result of a lengthy trial on their locomotives and steam ferry boilers on the Mississippi River induced the Chicago, Burlington & Quincy Railroad to purchase the patent, and this railway is now understood to have the batteries applied to upwards of sixty engines. An expert is stationed at Aurora to examine the engines and keep the batteries in order. It is claimed that by its use the interior surface of the boiler is even cleaner and less oxidized than when it was new; that a boiler will evaporate nearly or quite its maximum of 7 lbs. of water to one pound of coal, never going down to the average of 4 lbs. of water to 1 of fuel; that the saving in fuel and consequent increase of power being thus large, the vitality of fiber of the iron in the flues and fire-boxes is never destroyed by the intense heat necessary to penetrate the incrustations of foul boilers. A sheet from the most exposed locality, where it had been most fully tested, was taken out at Aurora and pronounced to be even tougher and more ductile than when it was new. A piece from a boiler which had no battery on it was as brittle as a china dish."

NEW SAFETY VALVE.—A correspondent of the *Railway Times*, writes: "A new and ingenious safety-valve arrangement has been brought out by an inventor at Wor-

cester, Mass. The valve requires neither spring nor lever, and no weight except its own for its operation. The valve, some three inches diameter and one and a quarter thick, is inclosed in a case, in which it works up and down easily yet snugly; it has a range of three-eighths to half an inch—its diameter and range must vary, of course, according to the capacity of the boiler; the lower face is flat, and its upper face slightly concave, and it has a small hole through its center. The bottom of the cup or case upon which it rests has a central hole for the escape of steam from the boiler; around this central hole, and concentric with it, are several segmental holes, through which the steam passes to the atmosphere. The valve covers all of these holes with a steam-tight fit. The reader will perceive that, if there were no other opening into the valve-case than the central and segmental ones just named, there could be no action to the valve, for the steam from the boiler would pass through the small hole in the valve into the space above it, and of course would press the valve upon its seat with a force in proportion to the aggregate area of the segmental holes. To relieve the valve of this pressure, a small auxiliary valve is fitted in the cover of the case, or perhaps one-fourth of a superficial inch area, which is adjustable to any pressure required. When this valve opens, the larger valve is relieved of its top pressure, and rises at once and relieves the boiler."

COMPOSITE SHIPS.—The *Engineering and Mining Journal* prints an article from an English journal upon the advantages possessed by composite ships over those of wood or iron alone, and appends the following remarks:—"The galvanic action which took place when other than copper bolts were employed to fasten the copper sheathing and the wooden planking to the iron frames, has necessitated the abandonment, to a great extent, of the composite principle. The cost of the copper bolts is excessive, and those of galvanized iron are not suited to the purpose. * * The apparent cheapness and strength of iron vessels ruined the shipbuilding interests of this country. Iron ships can be built more cheaply in England than here. American shipbuilding must be based upon the superiority and cheapness of the native timber for years to come. Our ship-yards are to a great extent idle because it is supposed that iron is superior to wood as a shipbuilding material; but let some Yankee find a cheap and reliable substitute for copper bolts, and we venture to predict that the composite shipbuilders of this country will, ere long, be able to compete successfully with the finest ship-yards of the Clyde or Tyne."

TORPEDOES IN OIL WELLS.—The Roberts patent for increasing the productiveness of oil wells, by the use of torpedoes has just been sustained in the United States Circuit Court, at Pittsburgh, Pa. The patent consists in sinking to the bottom of the well a water-tight flask, containing explosive material, and so constructed that its contents may be ignited by means of electricity. The result is in most cases to greatly increase the flow of oil. The theory is that the oil is in seams or crevices in the rock, of various sizes and irregularly located; and that a well sunk through the oil-bearing rock may not touch any of them, and thus may obtain no oil, though it may pass very near the crevices. The torpedo breaks through obstructions and permits the oil to reach the well.

RAILS OF PRIME QUALITY.—The Director of the Canada Grand Trunk Railway has placed on exhibition in the rooms of the Board of Trade at Montreal, samples of steel and iron used in manufacturing the rails for the road. Among these samples is an iron rail which was twisted cold thirteen times before fracturing, and was formed into the shape of a spiral spring. There are also plates bent by hammering cold across the grain, a double-headed steel rail, bent cold and elongated twenty-five per cent. An axle bent cold in a testing machine forms a complete knot without any fracture whatever.

CIRCULAR SAWS FOR STONE CUTTING.—J. E. Emerson, the inventor of the movable saw-teeth, has patented "the use of adjustable, reversible, and interchangeable chisels or cutters for sawing stone; also the use of adjustable diamond or carbon holders, the use of diamonds or carbons alternated with the chisels, and the manner of fastening them in the saw-plate."

SCIENTIFIC PROGRESS.

ANIMAL AND VEGETABLE KINGDOMS CONTINUOUS.—The following is from Prof. Wyville Thompson's lecture at Edinburgh University: "A plant cannot assimilate pure carbon, or hydrogen, or nitrogen; it seems that it can assimilate no elementary substance except oxygen, unless it be presented to it in the nascent condition. An animal stands in precisely the same relation to the binary compounds, carbonic acid, water and ammonia. However abundantly, therefore, it might be supplied with these binary compounds which actually contain all the elements necessary for its sustenance, it would surely die of inanition. In order to be capable of affording nourishment to the animal kingdom, these substances must be elaborated to the condition of ternary and quaternary compounds, and this can only be done in the cells of plants. This, then, is the broad and practical distinction between the vegetable and the animal kingdoms. Plants have the power of absorbing, modifying, and organizing inorganic substances, while animals are entirely dependent upon the organic substances thus prepared for their support. Taken in this sense, the distinction between the two kingdoms is most marked, and of the highest practical value; but when we set aside this one peculiar property, which is possessed only by some plants, and only by certain parts of those plants at certain periods of their life, and especially when we observe certain minute forms, of low organization, on the verge of either kingdom, it becomes absolutely impossible to assign any definite distinctive character. The character which is, perhaps, most palpable and universal, is that a mass of vegetable protoplasm is at some time during its existence, inclosed in a cell-wall, which is composed of cellulose, or some very nearly allied ternary compound. Animal protoplasm is rarely, if ever, confined in this way; that is to say, in nucleated cells, with cellulose walls, which are found in all plants, and are not found in the animal kingdom. * * *

Now, although the power which plants possess of fixing carbon and combining it with the elements of water, is the character which practically distinguishes the Vegetable from the Animal kingdom, I have already shown that we cannot regard this as by any means a universal test. In this respect broomrapes and dodders are animals. When we pass down by any path we choose, either through animals or plants, we come equally to a great series of very simple forms—mere little masses of protoplasm with a nucleus. Some of these contain peculiarly formed masses of bright coloring matter, green, scarlet, or yellow, and with the possession of such pigment we usually associate the power of decomposing carbonic acid. Many of these bodies have, however, no coloring matter at all, except what is derived from their food. A large number of these simple forms are enclosed in a wall of cellulose, but very many of them are naked or merely covered with a pellicle of firmer protoplasm; while some, such as the plasmodia of the myxogastrea fungi are, for some part of their lives, enclosed in a cellulose wall, and for another part, naked. Going still lower, we have Haeckel's Monera, differing from the others merely in the absence of a nucleus and the total want of differentiation of any part. Even these last are sometimes coloured, and from their chemical reactions it seems very likely that they possess some low form of the peculiar vegetable power. Now, the question is, whether all these considerations lead in any way in the direction of establishing a separate kingdom for these simple beings. I think decidedly not, but it seems to me that they prove almost to demonstration that organic nature must be taken as one whole, that the Animal and Vegetable kingdoms are absolutely continuous, and that a tree flinging its green flags into the sunshine and feeding on the winds of heaven, is essentially nothing more than a vast colony of a protozoon, comparable to a gigantic nummulate, only holding a cellulose instead of a calcareous shell, and developing a special secretion in special organs for the purpose of enabling it to do so."

THE NITRO-CHROMIO BATTERY FLUID.—The *Journal of the Franklin Institute* for June gives a letter from the Supt. of the New York Fire Alarm Telegraph to W. G. Levison, a part of which we copy:—"Ten days since, I put up your battery, viz., filled up the porous cup around the coke with dichromate of potash, filling up with

nitric acid, then in the glass jar a solution of sulphuric acid 1 to 10. At the same time I put up the same number of cups (five) of the electro-poison battery. Testing each battery through galvanometer with 38 miles of resistance, I found that each marked 40°. I then placed 5 cups of your battery in service (working two machines,) and two cups short circuited, with six inches of wire. These remained so for 20 hours; after which the 3 cups showed 28° and the 2 cups 10° through same resistance. I then for the same length of time, placed the electro-poison battery, 3 cups in service and 2 short circuited, and my tests then showed the elec. 4 cups to be 23° and the two cups dead. The new battery, on being tested at this time, showed 3 cups thirty degrees, 2 cups fifteen degrees. I have this afternoon found the 5 cups electro-poison dead, while the new battery is in such good condition that I have put the 3 cups in service again, and the two cups on short circuit."

STRING VIBRATIONS MADE VISIBLE.—In a recent lecture on "Sound," at the Royal Institution, Prof. Tyndall illustrated different rates of vibration by means of different tuning-forks with strings attached. He made the vibrations visible to the audience, —says the *Mechanics' Magazine*,—"by darkening the theatre, and illuminating the strings by means of the electric light, so that they threw long shadows on the screen, and when they were made to vibrate, shadow segments of a gauze-like appearance were seen. In another experiment he showed the segments in an exceedingly beautiful manner. A fine platinum wire, several feet long, was attached to one end of one of the tuning forks, and then made red hot by means of a current of electricity passed through it from a forty-cell Grove's battery. When the fork was then made to vibrate, the red hot wire was thrown into vibrating segments, and wherever it vibrated most it was of course most cooled by the air, so there became dark—lost all its redness. But at the nodal points it remained red hot. Thus by its own vibrations it was divided into red hot and dark sections. While thus vibrating, the red hot nodal points were hotter than while the whole string was at rest, because the cooling of the other portions of the wire increased their electrical conductivity, and thus a more powerful current acted on the points of no motion."

CONSERVATION OF FORCE.—In a communication to *Nature*, N. A. Nicholson says: "What, then, does the Conservation of Force doctrine amount to in plain English? It amounts to the simple admission that the tendency to move is a property of matter inseparable from it and coexistent with it, and it is this tendency to move which is the cause of all the changes which we observe around us. * * * Prof. Ansted says: "The first and greatest lesson that the students of Geography and Geology must learn is that motion is not limited to masses of bodies, but is actually taking place always and under all circumstances within all masses, whether solid, liquid, or gaseous, and often without approaching the surface." The Universe is one mighty system of changes, and these changes arise from the inseparable connection between matter and motion; and Dr. Benze Jones says truly, "The question between materialism and spiritualism is in fact only a question between ponderable and imponderable materialism."

HERSCHEL THE FATHER OF PHOTOGRAPHY. The author of a biographical sketch, in *Nature*, of John Herschel, who has just died at the age of 79, says that indirectly he may be regarded as the father of photography, inasmuch as he announced in 1819 the property of the hyposulphite of soda to "dissolve newly precipitated chloride of silver almost as readily as sugar." "To this property alone it was owing that, twenty years after, Daguerre was enabled to practically realize the hopes of Davy and Wedgwood, that the photographic pictures they had already obtained might one day be fixed and preserved."

DETECTING ARTIFICIALLY COLORED WINES.—Shipson proposes the spectroscopic for this purpose. He asserts that naturally colored wines give no definite absorption bands, but only a very general absorption, greatest toward the violet; whereas, Brazil wood and so on, produce very distinct absorption bands. He adds water if the wine is too dark. The least sign of an absorption band he deems suspicious. This method may prove of great value.—*Journal Franklin Institute*, June.

CORRESPONDENCE.

Right and Left.

EDITORS PRESS:—In your issue of June 3d is a communication over the signature of "Curiosity," in which the writer attempts to refute my argument on this question, by giving the result of several experiments made by himself and a friend, to ascertain whether a person would walk more to the right than to the left, and he assumes that the lecturer was entirely right in his conclusions. At the same time, the writer does not wish his experiments "to be regarded as conclusive, but only as strong evidence."

I can give "Curiosity" three good and sufficient reasons why his experiments ought not to be considered as conclusive, and why they furnish no evidence in support of the lecturer's theory.

First. His experiments were made with the eyes shut; and the natural tendency of a person groping in the dark is to rely on the protection of his "good right arm" as a fender from accidents by falling over obstructions or running against objects. The mind and body of the blindfolded person would therefore follow the leading of the dexter member aforesaid.

Second. The writer went out prepared to make the experiments in the interest of his theory of the matter, and, so far as his action of the matter is concerned, he is too swift a witness. To be sure, if a man wishes to go to the right in preference to the left, he can always do so, provided he is not in the hands of a policeman, who wishes him to go the other way.

Third. The distance traveled to the tree or post designated must have been comparatively short—too short to afford conclusive evidence.

An Experiment.

But I will offer "Curiosity" an experiment which he can make with his eyes open, and which will not only be conclusive, but which will afford him evidence that he can see with "half an eye."

Let him be set down in the center of a piece of woodland, in a locality with which he is unacquainted; and let the distance from his place of landing to the nearest open country be five or six miles, and no path or traveled road existing for him to follow. Having provided himself with a pocket compass he can take his course in any direction to find the open country; but he must not again consult the instrument until he emerges from the wood. On reaching the open place, and before turning to the right or left, let him examine the compass and he will find that he has diverged several points to the left of the course he had marked out for himself when he started.

The lecturer referred to in this discussion was correct in his premise, but wrong in his deduction. The right side, or the limbs carrying it, will show a tendency to outwalk the left, and I have no doubt of their ability to do so. But that is the very reason why the body should be carried more to the left in walking long distances. If a curve is described in any manner—and it seems evident that there is one—is it not more reasonable to suppose that the stronger and more enduring right limbs should take the outer and longer half circumference of the semicircle, while the weaker left leg and foot move upon the inner and shorter curve of the same?

How it is in Training Horses.

Several facts in the training of horses support this view. The principal acts in circus-riding are performed toward the left, which place the left side of the horse on the inside or shorter curve of the circumference of the ring. Race courses are laid out from the grand stand with the same purpose. Who does not know that there is always a contest for the "inside track," which, of course, is the shortest? And the weaker horse has a better chance of winning on that side than the stronger on the outside, because his left feet describe a circle of less dimensions than the left feet of his competitor. The "nigh horses," in a team of any number, are those placed on the same side as the driver, namely, the right side; and are always the stronger animals of each span. They are so placed that they may be within easier reach of his whip and his voice, and that

he may be the better able to urge them to use their strength in keeping the vehicle on a straight course; whereas, the tendency would be to sheer off to the left if the horses were not so placed. And, finally, horse-powers in the field, with revolving horizontal arms to each of which is attached a draft animal, are made to move to the left, so that the right limbs, being able to "outwalk the left," as said the lecturer, shall take the outside circumference of the circle traveled, being the longest in distance, and requiring more endurance and strength than the "inside track."

The force of the foregoing examples is in their evident confirmation of the position taken in my first article on this subject, namely, that the left leg and foot constitute the pivot on which the body swings in a state of comparative rest, while the right leg and foot perform the heavy work of locomotion. A pivot suggests revolving motion; and who ever saw a mechanical contrivance, even for perpetual motion, the moving parts of which revolved away from their pivotal center? From such a centrifugal catastrophe the Lord preserve the members of the human family, and all other families upon which they depend for subsistence!

Nature Bears Out this Reasoning.

All nature bears out the reasoning of the preceding argument. The right side of any natural object is always the largest and the heaviest. It is so with an orange, an apple, a pear, even a mustard seed. The skin and other portions of the right side of these will always be found thickest and toughest. The right side of a tree is the heaviest limbed, and the most umbrageous. The great globe itself, the earth which we inhabit, taking the north pole as its head, has more land out of water on its right or eastern hemisphere. And, what is very curious, if we take the east as the head, and the northern and southern hemispheres as the right and left limbs, we shall find more land on the northern or right side of the earth.

And in man, it is not only the right hand, arm, leg, and foot which are the largest and strongest, but the entire bodily economy also. The right eye, the right half of the face, the viscera of the right side—as the lung, liver, kidney, etc.—are also the largest. The circulation of the blood is toward the right side, as the one having the most work to do.

It must now be plain to your correspondent, as it is to me, that if the right limbs in "outwalking the left" cause the body to make a detour to the right, as the lecturer said, such movement must place the right side on the inner or shorter side of a curve, and give the left limbs more work to do than they are constituted to perform. He will at once see that this is very unphilosophical and improbable. It would make the right side the pivotal or resting one, and the left the energetic, strong and active working part of the body, which every one knows it is not.

PHILO SOPHUS.

The Hoopa Valley Reservation.

How Grant's Indian Policy Works.

EDS. PRESS:—Thinking that a few words from this distant locality might prove interesting to the readers of your excellent journal, I have concluded to drop you a few lines from Hoopa Valley.

This locality is about 50 miles above the mouth of the Klamath river, and about 10 miles above its junction with the Trinity. It is a beautiful valley about six miles in length, and averaging three-fourths of a mile in width. The Trinity river winds its way, from side to side, through its entire length. Nature seemingly could not have produced a more beautiful or appropriate place for a reservation, locked in, as it is, by rough, precipitous and almost impassible mountains.

The curse of Indian reservations, generally, is their easy communication with the outside world, where evil-disposed persons, having fear of neither God nor man in their hearts, carry on an illicit traffic in intoxicating liquors with the Indians. Here we are entirely free from this source of annoyance;—a drunken Indian on this reservation being an object that I have never witnessed.

Camp Garton, garrisoned by two companies of U. S. infantry and commanded by Col. Nelson, is situated in the center of the valley.

There are about 750 Indians on the reservation, who are at present peaceable and quiet; though it was only a few years since that they were the terror of Hm-

holdt, Klamath and Trinity counties. Four years since they killed the agent, Mr. Stockton.

How the New Policy Works.

President Grant, in pursuance of his policy of christianizing and civilizing the aborigines of the country, commissioned Rev. D. H. Lowry, of the California Conference of the Methodist Episcopal Church, as agent of this reservation, and under his administration a complete change has been wrought. Formerly the employes and whites generally were in the habit of cohabiting indiscriminately with Indian women, and many half-breed children is the result of this crying evil. All the employes at present are christian men, with their wives and children, who have left comfortable homes with the desire and hope of improving the condition of these Indians. Several of the ladies have started schools, and it is interesting to witness the eagerness with which they crowd around their teachers. A building is now being prepared, for a school-house, and will be finished in a few days, when a permanent day school will be established. Probably within the next twelve months, four or five schoolhouses will be erected and as many schools in successful occupation.

Agricultural Prospects.

While the denizens of the valleys are suffering from the drouth, we in the mountains are having an abundance of rain. There are about 700 acres in hay and grain, all of which look well and give promise of an abundant harvest. The soil is of a clayey nature and has been injured by being plowed too wet; and should we be visited with a drouth within the next year or two, this ruinous system of plowing will tell.

Another Lesson in Thorough Culture.

The strongest proof of the advantages of summer fallowing I have ever witnessed, is a field of wheat containing about 40 acres. This piece of grain is a strip in the center of a large field. It was plowed last year for corn, but not planted. This spring it was sown to wheat, which is headed out and looks as well as any grain I have ever seen; while that on each side of it is not yet headed out and does not look nearly so well, and I presume will not yield more than two-thirds as much. When harvested I will report the difference in yield.

Acting on the principle that "all work and no play makes Jack a dull boy," we concluded to have a "May Day" picnic. The officers of the fort and their wives joined us, and we spread our lunch on the side of a huge old mountain overlooking the valley, and enjoyed ourselves for an hour or two, when we returned to our home, all feeling better for our little frolic.

MORE ANON.

Klamath County, May 28th.

Blackberry Wine.

Don't can, or dry, or eat up all your blackberries. Save some of them for wine, of which a most excellent article can be made—good alike for the table and kitchen, and highly valuable for the sick room. In some classes of diseases, especially affections of the bowels, a first-class article of blackberry wine is more valuable than the most costly foreign wine, even when made from the pure juice of the grape.

One great reason why blackberry wine is not more appreciated is because it is so seldom properly made; and yet there is no difficulty in making a good article, and the process is very simple. A writer in the *Southern Planter* says he has made it for several years past, and never, in a single instance, failed to produce a good article by following the unjoined directions:—

Gather the berries when perfectly ripe, and in such a manner as to avoid bruising. Empty them, as fast as gathered, into a tub until you have a quantity sufficient to fill, with juice, the cask in which you propose to make the wine.

Have the utensils, etc., required in the process, all ready before you pick—or at least before you mash your berries. Everything must be scrupulously clean. You want a keg, a beater of seasoned hard wood, a pail, a large bowl, treen or other vessel into which to strain your juice, a good thick strainer—two or three folds of fine white flannel is the best material—a couple of yards of osnaburghs, a spare tub or a bucket or two, and a tub of soft spring water. Everything must be perfectly clean and free from dirt or odor of any kind.

Crush the berries thoroughly with the heater, and then after straining the liquor, which runs freely from the pulp through the folded flannel, empty it into the cask, measuring it as you put it in. When the juice has been all drained from the pulp, you proceed to press the pulp dry. If the quantity is large, this had best be done by a regular press, but if only a few gallons are wanted, the osnaburgh answers very well. Stretch out the osnaburgh, put a gallon or a gallon and a half of the pulp into the center, fold the cloth over it on each side, and let a strong hand at either end twist the cloth with all their strength; when the juice is well pressed out, remove and lay aside the cake of pomace, and put in more pulp. This process is apparently rough, but is both rapid and effectual. The juice so extracted is strained and measured into the cask as before mentioned. The flannel strainer and the osnaburgh may need rinsing occasionally during the work.

When all the pulp is pressed, put the hard cakes of pomace taken from the cloth into a tub, and pour upon them a little more soft spring water than you have clear juice; break up the balls and wash them thoroughly in the water, so as to obtain all the juice left in the mass, and then strain it clear; measure out as many gallons of this water as you have of clear juice, say five gallons of the water to five gallons of the juice, dissolve in each gallon of the water six pounds of sugar, (brown or white as you want a common or first-rate wine,) and when thoroughly dissolved, add the juice, (first passing it again through the strainer), and mix them. Then rinse out your cask, put it where it can stand undisturbed in a cellar; fill it perfectly full of the mixture, and lay a cloth loosely over the bung hole. In two or three days fermentation will commence, and the impurities run over at the bung; look at it every day, and if it does not run over, with some of the mixture which you have reserved in another vessel, fill it up to the bung. In about three weeks fermentation will have ceased, and the wine be still; fill it again, drive in the bung tight, nail a tin over it, and let it remain undisturbed until the following November, or what is better, March. Thendraw it off, without shaking the cask, put it into bottles or demijohns, cork tightly and seal over.

For a ten gallon cask, you will need about 4½ gallons of juice, 4½ gallons of water and 26 pounds of sugar, and in the same proportion, for larger or smaller quantities. Some persons add spirit to the wine, but instead of doing good, it is only an injury.

Another process is, after pouring in the mixture for a ten gallon cask, to beat up the whites of two or three eggs into a froth, put them into the cask, and with a long stick mix them thoroughly with the wine. In five or six days, draw the now clarified wine off by a spigot and without shaking the cask at all, into a clean cask, bung up and tin, to be drawn off into glass in November or March.

The more carefully your juice is strained, the better the quality of your sugar and the more scrupulously clean your utensils, particularly your kegs are, the purer and better will be your wine.

The best quality when you gather your own fruit, and make it yourself, costs you only the price of the white sugar, and when bottled will cost you in money about twelve and a half cents a bottle.

DOES BLACK WALNUT DESTROY FRUIT TREES?

Mr. O. Snowberger, of Quincy, Pa., writes to the Farmers' Club, in New York as follows:—"I feel satisfied that I have seen three apple trees destroyed by black walnut, and I believe they destroy grape vines. I judge it is the water dropping off the walnut leaves that does the work." Have any of our readers met with any similar experience? If what is stated by Mr. Snowberger, is a fact, it is one which should be generally known, as the large number of people in this State who are now planting black walnut, would, under such circumstances, take special care to place them in localities where no such damage could occur.

BENEFIT OTHERS AND PROFIT YOURSELF.

Ben Holladay is the leading spirit and Joseph S. Wilson the President of the Oregon Land Company, which is forwarding scores of good Western farmers and German immigrants to our moister neighbor, where stock lands range from 50 cts. to \$1.50, and average farm lands from \$2.50 to \$5 out of Willamette, and \$10 in Willamette valley.

MINING SUMMARY.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ANOTHER STRIKE.—*Chronicle*, June 17: The Schnecktady Co. has run into another body of ore deposit in the middle drift, and 10 or 12 feet more will reach the main body. In the lower tunnel some more good ore has been found. This will furnish plenty of ore for milling.

IN ORDER.—The Exchequer mill is being placed in order for active operations.

BARNES' CLAIM.—Advices from Supt. Barnes are that he will leave within a few days for Hope valley to resume work on his claim.

TARSHISH.—*Miner*, 17th: During the past two weeks some important discoveries have been made in the Schnecktady. It is said ground will be broken for the foundation of reduction works about the first of July.

The furnace of the Monitor and N. W. mill is going up rapidly, the wood work far advanced toward completion, and the flume being thoroughly overhauled and strengthened. Over 50,000 pounds of machinery is being delivered to-day by teams from Reno. The No. 3 main tunnel is expected to start up with full gang next week.

AMADOR COUNTY.

The strike goes on. Troops are on the ground, and the pumps were all started on the 27th. The general feeling of the people in the county is against the strikers; for business of all kinds is at a standstill in consequence of their action. In any case, the members of the "League" will be set aside, and other hands will be employed in the mines. So much for "Leagues" which undertake to coerce outsiders.

KENNEDY.—*Ledger*, 24th: This mine is steadily improving, and at present they have a well defined vein six feet in width. The Co., have commenced another "sinking," intending to go down one hundred feet deeper and thus secure a sufficiency of rock to keep their mill running all winter.

SHUT DOWN.—Work on the Coney mine has been stopped for the present, the owners preferring to remain idle until the difficulties in this county come to an end.

CALAVERAS COUNTY.

GOLD.—*Chronicle*, 24th: The Palomo mine in Lower Rich Gulch is giving out \$4,000 per week as usual. When the shaft is sunk two hundred feet deeper, and an additional battery of forty stamps put in motion, we expect to be able to place the weekly shipments at \$20,000.

STRUCK IT.—The Union Shaft Co. in Corral Flat, have struck rich gravel. Ten dollars to the pan have been obtained.

NEW MILL.—The mill on the Whisky Slide mine, Hardigan, Laden & Co. is nearly completed. The battery is to be of ten stamps.

BIG MINE. H. H. Sheldon, Supt., of the Big mine near Railroad Flat, informs us that the lead is developing favorably. Since the new company commenced operations the mine has paid a considerable amount above expenses. Machinery is to be erected as soon as practicable.

GOOD PROSPECT.—A week or two since we stated that the mine belonging to Matthews, Foster & Co., near Whisky Slide, had been conditionally sold, and that the parties purchasing had a quantity of rock for crushing. Since then the quartz has been worked, yielding \$17 per ton. The rock was unassorted. There is quartz in sight, however, that will pay \$150 per ton.

WORK COMMENCED.—Work has been commenced on the old Foot & Thompson quartz lead, near Rich Gulch Flat. Eight men are employed, and the force will be increased. The mine was extensively worked years ago, but lately conflicting titles to the lead have prevented. We understand that the agent of a San Francisco company has effected an arrangement with the various parties in accordance with which he is to prospect the lead for six months with the privilege of purchasing.

ELDORADO COUNTY.

CAPT. LEE AROUND.—A correspondent of the Placerville *Democrat* writing from Georgetown on the 13th inst. says: The celebrated Woodside mine, which has been lying idle for several years, was bonded during the past week by Capt. S. W. Lee and A. Muir, Esq., of San Francisco, who will in a few days commence operations. The Woodside ledge is that in

which, a few years since, a pocket was said to have been struck so rich in solid gold as to compel the owners to have it cut up in pieces with chisels.

INYO COUNTY.

CERRO GORDO.—Cor. of *Independent*, June 17th: The furnace property of Mr. V. Beaudry, lately destroyed by fire, is being reconstructed as rapidly as material can be procured. The works of M. W. Belshaw & Co. are in constant operation.

GOLD MOUNTAIN DISTRICT.—Palmetto Cor. of same: Messrs. Shaw & Ruth made \$60 in four days with their mule arastra.

GREEN MOUNTAIN.—Farthing, Gallagher & Co. have commenced work on the "Green Emigrant" lode. They have thoroughly prospected their claim, and find the rock to assay firmly from \$700 to \$1,200 per ton.

Silver Peak is dead. Palmetto is worse, being abandoned; although the Champion, in the last 42 days' run, yielded \$83,000, and the New York ledge, seven feet wide at depth of 60 feet, assays \$450 per ton.

IREMS.—The Eclipse Co. is building a smelting furnace. June 12th there were shipped from the mill of Hiskey & Walker, at Deep Spring Valley, two bars of bullion, weighing 320½ ounces, valued at \$280.

MARIPOSA COUNTY.

The *Gazette* of June 23d says that Dau. Jones, lessee of the Oakes & Reese mine, Hunter's Valley, is taking out some very rich rock, some of which we saw. Most of the rock will average \$50 per ton. About 30 men are employed about the mine and mill.

The Washington mine and mill, near Hornitos, are in full operation, taking out good rock. The company are sinking a new shaft.

NEVADA COUNTY.

WEBSTER CO.—*Grass Valley Union*, 20th: The Company give notice of their intention to remove their principal place of business from Grass Valley to San Francisco. Also increasing the capital stock to \$500,000.

DARTMOUTH.—The company have a ten-stamp mill, purchased from the Dromedary Co., on the ground ready to be put up, and a tramway about completed for running out the gravel to the mill through a tunnel they have commenced into Alta Hill.

GLENBROOK CLAIMS.—Same of 21st: The race track claims worked for some years by Shaw & Co., have been purchased by Peter Ismert, who will continue to work them by hydraulic.

MANHATTAN.—Same of 25th: A crushing of 37 loads of rock was yesterday made at Ben McCauley's mill; proceeds \$1,260 or \$37 a load. The sulphurets saved are rich, and will put the yield at about \$40 a load.

NEW YORK HILL MINE.—Same of 27th: The machinery has been put in order, smoke and steam can be seen at the mine, and the pumps started yesterday morning. The mine has lately changed hands. The water will be pumped out as rapidly as possible, repairs made, and crushing commenced.

SCHOOLBOX LEDGE.—*Transcript* June 22: The ledge, at Gold Flat, has been purchased by McAuslin & Co., who have run a tunnel two hundred feet, and on Saturday struck the ledge a foot and a half thick and filled with rich sulphurets and galena.

KEYSTONE GRAVEL CO.—Same of 24th: This company have purchased four or five claims on Montezuma Hill, which they have consolidated. The gravel prospects well 200 feet above the bed-rock, and as high as \$90 to the pan has been obtained from the gravel. The new Co. propose to open the channel by two bed-rock tunnels, one giving outlet into Shady Creek, and the other into the Ynba.

PENNSYLVANIA MINE.—This mine has just been sold to a San Francisco company for \$45,000. A year ago this was one of the "played out" mines. It had "husted" two companies, leaving the last owners in debt \$17,000. J. H. Helm then took it. A new level was opened and a well defined ledge of 3½ feet struck. The rock has for several months past yielded an average of \$40 per ton—and with a four stamp mill the clear profit has been \$4,000 per month.

HYDRAULIC MINES.—*Appeal*, 23d: The mines near San Juan are yielding handsome returns. The America has yielded \$2,000,000 since it was opened. They are now running a tunnel from the Yuba river, two miles to get at the bed-rock of the old channel.

CEMENT MILLS.—The cement mills around French Corral work to a charm, and the owners are realizing large profits from their investments.

PLACER COUNTY.

BIG MONEY.—*Stars and Stripes*, June 22d: Yule's claims, above Last Chance, yielded

114 ounces worth over \$2,100 for the six days ending with Friday June 16th. Weske's claim, at Turkey Hill, above Michigan Bluff, yielded 514½ ounces for the week ending June 17th, for which Stroebel of the Bluff paid him \$9,004. This gives Yule & Co. over \$4,100 and Weske over \$15,000 of dividends for three weeks last past.

GREEN MINE.—*Grass Valley Union*, 25th: A gentlemen from Auburn informs us that a two weeks' run of the mill of 4 stamps has resulted in \$50,000 in gold. The clean-up is almost unprecedented in the State.

SIERRA COUNTY.

GOOD HOPE MINE.—*Messenger*, 24th: The purchaser, Mr. Curtis, has built a wagon road to the mine at an expense of over \$500; has sunk a shaft and will be taking out rock in a few days. The old Wheeler mill, four stamps, has been leased and put in order.

KANAKA.—Parties are here from San Francisco looking into the affairs of the Kanaka Mine with a view to commencing work.

WATER.—Water has failed in most of the mining camps of this county. There is just about enough left to clean up with.

RIVER MINING.—*Age*, 24th: A Chinese company is building a wing-dam below the north end of Durgan bridge, so as to turn the river against the south bank. They expect big pay in the bed of the main channel.

Ware & Donahue, on Rattlesnake, near Clark's ravine, a few days since found a nugget weighing six ounces.

TRINITY COUNTY.

DRIVING.—*Journal*, 24th: J. C. Mason & Co. are driving ahead with the tunnel to open their claims on Union Hill. They are in 330 feet, running day and night, and making twenty feet a week.

TRINITY RIVER.—Cor. of same: Hager & Haas have finished cleaning up and have done well. Weise & Volmers' claim is a good one. The Reno Flat claim still pays. Dacy Bros. are cleaning up, with favorable prospects. Some of the claims were forced to quit work very early on account of the limited supply of water.

TUOLUMNE COUNTY.

IREMS.—*Sonora Democrat*, 24th: The Knox & Boyle claim near Poverty Hill, last week yielded \$2,200 for seventy-eight tons of rock crushed. Mr. Sherwood who has been prospecting the Spring Gulch claim, north fork of the Tuolumne, has contracted for the erection of a ten stamp mill.

Nevada.

ELY DISTRICT.

BULLION.—*Record*, June 22d: Wells, Fargo & Co. shipped, on June 14th and 17th, by the way of Salt Lake, bullion valued at \$21,309.91.

CRESCENT DISTRICT.—At a meeting of miners held at Crescent (near Hiko), June 10th, a new district was formed out of a portion of the old Pahranaagat District. New life appears to have been infused into mining matters in that vicinity.

STARTED UP.—Crescent mill, long idle, has started up again with a prospect of running steadily. The mill is at present running on custom rock of high grade from Tempiute and Crescent.

A correspondent of the *Enterprise* writes from Pioche, June 17th: "It is true we ship a great deal of bullion, but there are too many men here to be profitably employed at present, or rather there are not enough mines sufficiently developed to give everybody work. General Connor is bringing water into town and perhaps we will then have one or two mills erected. This would obviate bauling the ore twelve miles, which is now done."

EUREKA DISTRICT.

PHENIX CO.—*Sentinel*, June 20th: For some days past the Co. has been getting out \$370-bullion. Last week a purchase was made of the Jenny Lynch mine for the purpose of getting the necessary lead to run the richer ores. Yesterday, at San Francisco, Judge Lake sold the Otho mine, that he purchased of McGee, Stont and Thompson, to the Phoenix Co., and at the same time, the Supt. leased the Jackson furnaces, and is already having ore and coal delivered. To-night they will commence smelting.

BULLION SHIPPED.—From the 1st of May to the 15th of June, there were shipped to Palisade, by the fast freight line, 462,000 pounds of bullion. The other lines have been shipping at the same time. During the time the furnaces have been accumulating bullion and have a large quantity now on hand.

THE NEW STRIKE.—Same of 21st: The explorations in the Richmond have been continued, and now, at a depth of 74 feet in an incline, and at the end of a drift 118

feet long, the ore is in larger quantity than in any mine in the district. Up to this time, neither top, bottom nor sides have been discovered, but it seems an immense deposit of the richest ore.

Mr. Bragg, of San Francisco, has purchased the one-half interest of Moses Wilson in the Roslin mines and furnace for \$40,000 gold coin.

BUTTERCUP.—Same of 24th: One of the furnaces of the Buttercup Co. was started up yesterday and the other will start in a few days.

A telegram of the 27th says that Mr. B. S. Bernard of San Francisco has purchased the following mines: Bullwhacker, Elephant, Premium, America, Eldorado, El Dorado No. 2, Minna, Minna No. 2, Lady Byron, Valentine Day, Ida Dudley, Fir Grove, Letter B, Tacoina, together with the Chicago furnace. The Company will be known as the Lander Consolidated, and will erect four more furnaces. Assays from some of the above have gone as high as \$140 per ton. It is estimated that eight thousand tons of ore are in sight in the Bullwhacker alone. An immense new body of ore was struck yesterday in the Adams and Farren mine by the Phoenix Co. equal to the best produced by the Eureka Consolidated.

HUMBOLDT.

GALENA.—*Register*, June 17th: We learn that the Nevada Butte Co. have completed their 20-stamp mill, and will start up Monday, on ore from the Butte mine.

RICH ORE.—Gregg & Fink shipped from the Gregg mine, Gold Run district, to the Reno mill, four tons of ore, and the gross result was \$212 per ton.

CENTRAL DISTRICT.—*Silver State*, June 17th: Clark Brothers have just completed a shipment of 40 tons to the Butte mill in Rye Patch for reduction.

ARIZONA CO.—The new mill for tailings was started up on Wednesday, and all the machinery is working to the satisfaction of all parties. Work will be commenced on the tramway on Monday.

BOLLION.—The amount shipped from the Arizona mine, through Wells, Fargo & Co., since our last issue, was \$7,818.50.

RELIEF DISTRICT.—The Batavia and Pacific Co. are down 80 feet, and have 1,500 tons of fine ore on dump. They are putting up a 5-stamp mill, which will probably be running by July 15th. A roasting furnace will be added.

RAILROAD DISTRICT.—*Elko Independent*, June 17th: The ledge in the Rising Sun mine is ten feet wide, and works \$150 per ton. It belongs to Mr. Houghtaling. The Lyon, belonging to Morgan & Peyton, works \$100, and has six narrow streaks, an inch or two thick, that will assay \$300.

REESE RIVER.

THE SITUATION.—*Reveille*, June 21st: Mining has been going on in Austin since the spring of 1863, and the prospects of the district have never been more flattering than to-day. The best proof of this is that not one of the cabins in the edge of town is empty. Two years ago a new comer could step in and take possession of deserted lodgings almost anywhere.

SHUT DOWN.—Same of 24th: The Manhattan Co. mill is closed to enable the workmen to erect the amalgamating machinery. The force at work is as large as can be crowded in the building. The addition will increase the capacity to 30 tons per day. The steam works on the Oregon shaft are being taken out and heavier ones put in. The new pump is one of the largest in this State outside of Virginia and Gold Hill.

WASHOE.

IREMS.—*Gold Hill News*, June 20th: The Yellow Jacket is yielding 175 tons of ore per day from the 800, 900 and 1,000-foot levels, milling \$40 per ton. During the past week 220 tons of ore were taken from the Overman, assaying \$17 per ton. The principal yield is from the 226-foot level. The Caledonia yields 90 tons per day, keeping two mills running. The ore section is from the 300-foot level up. The Segregated Belcher is not yielding much ore. The sinking deeper of the Ophir shaft progresses, with no serious impediment from water, and it is estimated that it will take seven months to sink to the contemplated depth of 1,400 feet. On the 14th inst., \$22,975 was sent down from the Crown Point mine and \$31,689 from the Chollar-Potosi. Savage is yielding 175 tons of ore per day, and Hale & Norcross about the same.

Same of 21st: The new 60-horse power hoisting engine in the Crown Point works splendidly. Dall's mill, Washoe valley, destroyed night before last, was insured for \$80,000.

IREMS.—Same of 23d: The Buckeye mine, near Silver City, is being put into

first-rats working shape, and is already yielding handsomely. The daily yield is 40 tons, which is reduced at the Franklin mill. The sinking of the Gould & Curry shaft is progressing, and indications are encouraging. During the week 380 tons ore was taken from the Sierra Nevada mine. An arrangement will probably be made to work the Belcher through the Crown Point.

Sams of 24th says that the Savages struck a stream of warm water at its lowest level—1,400 feet—which has given its pumps all they could do, as well as those of the Hale & Norcross, which connects with it at the ninth level. This water now furnishes a supply for all the mills along the cañon. It is, moreover, considered a very encouraging indication of a large body of ore in the immediate neighborhood.

Same of 26th says the water has considerably lessened.

The Crown Point is running six mills, and the bullion receipts foot up to \$300,000 per month. The ore body widens out toward the Belcher mine, and the face of the drift shows improved assays.

The Enterprise of 25th thinks the water-flow in the Savage indicates a great parallel vein east of the Comstock.

SUTRO TUNNEL.—The tunnel was yesterday in a distance of 2,155 feet. The rock has changed again, and is now harder than it was one week ago.

The Champion lead, Diamond district, is from 18 inches to 6 feet wide, and the ore assays on an average, \$277. Some of it goes \$700.

WHITE PINE.

REVIEW.—News, June 24th: North Aurora is developing into a first-class mine, the ore now being hoisted netting at the mill an average of \$92 per ton. The engine for the hoisting works, on the main shaft of the Ward Beecher, has arrived. Eberhardt & Aurora shipments of bullion for the week ending to-day, foot up \$41,393.05.

The South Aurora has improved in appearance greatly, and the Stanford mill, which has been shut down for repairs, will shortly resume operations. There are at the mill 700 tons of good awaiting reduction, and on the surface dumps of the mine twice that amount awaiting shipment. The Ward Beecher Consolidated, which has recently commenced the shipment of ore, has become involved in litigation. We know nothing of the merits of the case. On the western slope of White Pine mountain a number of old locations have been started up, and the mines on the spur of the hills which surround Hamilton on the west are improving as depth is attained. At the present time a great deal of work is being done in that locality. It is expected that the Monte Cristo mill will start up within 30 days, and we will then have a thorough test of the capabilities of the Stetefeldt furnace in working our base ores.

The bullion shipments for the week amount to \$48,817.94.

Arizona.

BRADSHAW.—Prescott Miner, June 10th: Moreland & Co. original locators on the Tiger, have out of their deepest shaft, 140 tons of first-class ore, which will yield over \$6,000 to the ton; besides 250 tons of second-class ore which may go as high as \$1,000 per ton. The surface of every piece of ore is literally covered with native silver. The same is true regarding the other claims on the Tiger, all are rich.

HASSAYAMPA.—Messrs. Bean, Groom, and Davis have opened the Davis lode in two places, and taken out 200 tons. Crevice ten feet wide.

WALKER.—Water is scarce, and but little is being done. The Thunderbolt mill is running.

Big Bug mill is idle, waiting for water. Same of 17th says that a few days since, \$10,000 were offered for 100 feet in the "Tiger" lode: the offer is still pending and may be accepted.

Colorado.

ITEMS.—Herald, June 21st: Bennett, Gray & Root are taking out large quantities of paying ore on the Kansas—50 tons going to Hill every week, besides a larger amount of mill ore elsewhere....Hill & Berger are shipping ore from the Seventy-third lode, which is believed to be an extension west of the Cariboo. This mine is furnishing rich specimens of native silver....The water is out of the Idaho lode, and the crevice makes a good showing.

SUMMIT COUNTY.—Denver News: Very rich diggings discovered on Wilson Creek....French gulch is prospecting at the rate of \$1 per pan....The General Grant at the mouth of the gulch, are taking out good wages....The largest enterprise in the county is that of the Springfield, Greenleaf

& Haywood. They have put in a flume, five hundred feet in length. They expect to take out one ounce per day to the man. They are working twenty-five men....Five companies are working Georgia, Hunnig and American gulches, taking out one ounce to the man per day....In Illinois gulch, Wm. McFadden is working six men, realizing from \$6 to \$8 dollars per day each....Mover & Hangs are taking from Stillson patch one-half ounce a day, each, with three men....Stone & Adams, in Iowa gulch, one and a half miles from Breckinridge, are working five men and taking out one-half ounce each, per day....Colonel Chandler, of the Boston Mining association, arrived in Breckinridge last week. He brings \$70,000, which will be devoted to the struction of reduction works, at the junction of Bear Creek and Snake River or at St. John.

BULLION.—Miner, 15th: The total shipped since our last issue, was 11,796.9 ounces, coin value \$12,307.50.

ITEMS.—Same of the 23d: On Monday the Burleigh tunnel had reached a distance of 1,058 feet.—The adit on the Magnet lode has reached a distance of 170 feet, and has passed some large deposits of rich ore....There is great activity in the mining camps over the range....The Mammoth Mine continues to furnish a large quantity of pay ore....One of the boom ditches on Leavenworth Mountain has uncovered eleven lodes. One of the lodes has 18 inches of mineral....A test of Terrible ore, of 2d class, one ton each from the shaft and from the tunnel level, gave respectively 73 ozs., and 178 ozs.

Montana.

IDAHO DISTRICT.—Helena Gazette, June 19th: By a miners' meeting at Indian Creek, June 6th, it was resolved, that all mining claims must be represented within 30 days; and that those represented might lie over for one year.

FREDRICKSON.—The Miner's ditch is carrying 1,500 inches of water. Some 200 men are in the district working night and day, and all the indications are favorable. In Dry gulch Gillis, Laveridge & Co., are working six men, Potello & Leideman four men and Bisnet, Murphy & Co., three men.

GOOD YIELD.—Independent 16th: Mr. Pat Karr, from Blackfoot, informs us that his company cleaned up from their claim in Illinois gulch, after eight days' run, one hundred and eight ounces, or about \$2,000.

CABLE.—E. D. Aiken tells us that matters are looking up. The ditch is carrying 200 inches of water, and mining will begin in earnest next week. Work is progressing upon the Cameron ledge, with good prospects.

HIGHLAND.—Charley Ganter and Charley Moore are taking out from \$400 to \$600 per week on the old Pfifer ground, in the main gulch. Nevins & Co., are taking out first class ore. The Only Chance arastras are running and the yield will be greater than ever.

SILVER BOW.—There is 900 inches of water in the creek and there is a probability that there will be enough to supply the ditch with a full head all summer.

GERMAN GULCH.—There is more water in the gulch this year than has ever before been known, and the vast amount of snow now on the mountains is indicative of a hounteous supply during the whole season.

BLACKFOOT.—On Ophir Bar, Headney, Karr & Co. are running a hydraulic and making \$20 per day to the hand. Near by in the Illinois gulch, McCoy, Boyle & Co. are working some of the best ground in the country. On Upper Ophir gulch, Dan Johns, Brown & Maupin, Carr & Frazier, Pront & Co., Jas. Bingly, and several others, are mining with better results than at any time. For six miles down Ophir, from Blackfoot City, the best of mines are being worked on bars, hills, and in Gulch.

On Carpenter's Bar there are six hydraulics running day and night. In Snow Shoe, Rufus Johnson is running a hydraulic in the lower part of the gulch, with a bank of gravel ten feet deep, that prospects as high as \$1.50 to the pan. On Gold Hill, Johnson & Co. have been making as high as \$50 to the hand. On Upper Snow Shoe, Pat, and James Kelly are reported to be making an ounce per day to the hand. At Gold Canyon, still further on, towards the north fork of the Little Blackfoot, two men drifting took out 20 ounces last week.

Utah.

BULLION.—Salt Lake Herald, June 16th: Buel & Bateman shipped to the Omaha works, on Wednesday, forty-one tons of bullion; and yesterday ten tons more. They expect to ship a car-load of ten tons a day regularly, with an extra car load every third day. This will make eighty tons a week.

Mining Stock Market.

(S. F. Stock and Exchange Board.)

San Francisco Thursday Eve., June 29.

The stock market has been quite irregular but yet active during the past week with a marked fall towards the close. Amador has sold at \$300 and Eureka at \$65 to \$52½. On Monday 2,000 shares of Ophir were sold at steady prices.

The following table gives last Thursday quotations compared with to-day's, and the highest and lowest points reached by the several descriptions of stock during the week.

June 22. Highest.	Lowest.	June 29. Adv.	Dec.

Wax Side Leather, @ foot.....	18¢

TO THE MINING INTEREST.—Believing that they can thereby do the mining interest the managers of the Eighth Industrial Exhibition of the Mechanic's Institute request contributions of ores, minerals and metals from the mines, mills and furnaces of the coast. Such contributions will be given a prominent place, and will be labelled, with details furnished of the condition, etc., of the works from which they come. The collection, if a full one, will attract attention and carry far our message. Wells, Fargo & Co., will forward, free of charge, all such packages, to be sent before August 5th, addressed to Mechanic's Institute, care J. H. GILMORE, San Francisco.

A FLORENCE SEWING MACHINE, but slightly used, and good as new, for sale at 10 per cent. less than its cost—\$67.60. Part of the money may be paid in installments by a person who gives good recommendations—in the city, or in the country near San Francisco. To be seen at this office.

FOR COUGHS, COLDS, AND THROAT DISORDERS, use "Brown's Bronchial Troches," having proved their efficacy by a test of many years. The Troches are highly recommended and prescribed by Physicians. Those exposed to sudden changes should always be supplied with "The Troches," as they give prompt relief.

Owing to the good reputation and popularity of the Troches, many worthless and cheap imitations are offered which are good for nothing. Be sure to obtain the true "Brown's Bronchial Troches." Sold everywhere.

AGENTS CAN MAKE FROM \$1,000 TO \$5,000 A YEAR in almost any section of the country, selling Dana Bickford's new and improved FAMILY KNITTER. This Machine is guaranteed (in its present completeness) to meet every want of the household for either domestic or fancy work. Price \$25. Send stamped envelope with full directions for an illustrated book. Address: DANA BICKFORD, Vice President and General Agent, 689 Broadway, N. Y. 23v22-6m-lp

\$5 to \$20 PER DAY AND NO RISK.—Do you want a situation as salesman at or near home to introduce our new 7-strand White Wire Clothes Lines, to last forever. Don't miss this chance. Sample Free. Address: Hudson River Wire Works, 75 William street, N. Y., or 16 Dearborn street, Chicago, Ill. 23v1-12mbp

LADIES DESIRING TO PROCURE A FIRST-CLASS SEWING Machine against easy monthly installments may apply to No. 294 Bowery, 157 E. 20th, 477 9th Ave., New York. Good work at high prices if desired. 23v1-12mbp

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Out Glass to order on reasonable terms. 14v20

Metallurgy and Ores.

Richardson & Co., Copper Ore Wharves, SWANSEA.

RICHARDSON & Co. have been for thirty years established in Swansea as Agents for the preparation, Sampling, Assaying, and Sale of Copper, Silver, Gold, Lead, Zinc, and all other Ores and Metals, for which they have extensive Warehouses and Wharves under cover, 1,800 feet of Quay Frontage within the Floating Dock, and the most complete Machinery and Appliances. They are also prepared to make advances against Ores in anticipation of realization, and to guarantee all payments when required. 5v22-lys

LOUIS FALKENAU, STATE ASSAYER, Analytical and Consulting Chemist, 421 Montgomery St. up stairs.

Particular attention given to the Analysis of Ores, Minerals, Metallurgical Products, Mineral Waters, Soils, Commercial Articles, etc. One or two pupils can receive theoretical and practical instruction in Assaying, Analysis, or any particular branch of Chemistry at the laboratory. 11v21-3m

CALIFORNIA ASSAY OFFICE No. 512 CALIFORNIA STREET, One Door West of Montgomery.....SAN FRANCISCO.

J. A. MARS, Assayer. Analysis of Ores, Mineral Waters, etc. 10v36

Stained Glass.

The modern method of staining glass is about as follows: A full sized cartoon of the subject to be portrayed is prepared by an artist; the figures and other objects to be represented being drawn in bold, dark outlines, specially adapted for the exigencies of a painting upon glass. From this picture a "cutting drawing" is made, generally on canvas, whose outlines are little more than a simple diagram for the guidance of the glazier, the outlines of the pieces being made to correspond exactly with the leaden ribs by which they will ultimately be fastened together. The glazier, who works under the superintendence of the glass stainer, having duly performed his share of the work, sends back the glass, cut to the required patterns, into the room of the stainer. The latter arranges the pieces of glass upon his table, and then, with a camel-hair brush, covers evenly the whole temporarily united surface with a coloring hase or oxide, called *mat*, which is either red or black, as may be required. On this surface he next traces, with the proper pigments, (prepared generally with gum-water) the more elaborate outlines of the drawing, which are to be burned into the glass. All the coloring matter afterwards receives a coating with spirits of tar. After the pieces of glass have been thus prepared, they are taken away to be "fired," or baked, in a hermetically sealed kiln, where they remain for about nine hours, exposed to an exactly tempered intense heat, until the different colored metallic oxides have thoroughly combined with the surface of the glass.

The thick iron door in the front of the oven, or kiln, is carefully built up with bricks, previous to the "firing;" two long "nozzles," affixed to the door, being left projecting through the bricks, to enable the workmen from time to time to ascertain the exact stage of the burning-in process. The glass lies, with the painted side uppermost, on the iron shelves of the kiln, each shelf having been rendered perfectly level by a thin coat of whitening or prepared lime, to prevent any bending or deflection of the glass.

To indicate the attainment of the proper degree of heat, two small pieces of glass, called "watchers," are placed in front of the shelves within the oven, where they can easily be seen through the nozzles. The heat of the kiln, is regulated by an iron damper half way up the flue. When the workman sees that the colors have become thoroughly fixed through an incipient fusion, the fire below the kiln is at once drawn, and the glass left to cool of itself, or anneal, which it does in twelve or fourteen hours. The pieces, now totally changed and beautified, are sent back to the glazier, who, by the help of his cutting drawing, "leads them up," or sets them in the leaden frets, thus combining them in one harmonious whole. The apparatus for rough casting the frets, and for moulding them into the requisite forms, is very simple and effective.

In drawing the original cartoon, the special determination of the outlines is of

the last degree of importance; for the leads will have to form the darker outlines of the picture—intensifying, instead of injuring, or in any way interfering with, the general effect. A carefully considered disposition of the drapery of figures must likewise be attended to, and such a judicious treatment be exhibited in the folds of the raiment, and in the smoother portions of the same as may serve to throw them into strong relief. It is impossible to get the "half shadows" of an ordinary picture into a glass painting, and numerous and interesting are the clever devices of the glass-stainer to obviate the difficulties inseparable from the exercise of this beautiful art.

Editorial Notes Eastward.—8.

Nevada to Utah.

Ever onward rushed our train, hearing us nearer our "home," as our elder generation in California still term the place of our nativity, however long we may have been on the Pacific Coast. Our children will no more think and speak thus of the East; and although it is pleasant to reflect on the strong tie between us now and our sister States, yet we cannot but be glad that on the shores of the grand Pacific our descendants will find "the dearest spot on earth—sweet home."

We pass over the plains of Nevada, reaching and leaving behind the many

a feat never achieved before or since that time.

And while we sleep; unless the memory thereof incites us to rise at an exceedingly early hour of the morn, we pass by the scene of one of the grandest celebrations ever held in our land. Where, on the 10th day of May, 1869, the West and the East came together; where the iron links of the Atlantic and the Pacific were firmly connected by gold and silver rivets of California, Nevada and Arizona; where the iron horses of either slope, after a weary travel, met and rubbed noses in the most friendly fashion; and where was completed a work which, to a certain extent, may be fairly said to have revolutionized the trade of the world. How the last spike was driven, each blow echoing from the alarm

COL. THOS. A. SCOTT, PRESIDENT OF THE U. P. R. R.

hells of all the large cities in our Union; how speeches were made and friendships pledged in golden wine; and even "what the engines said,"—all these have been stated and restated in the journals of the land.

The U. P. R. R. and its President.

The place where the rails met is not the place of the present junction of the Central and the Union Pacific. Ogden is now the junction, and at this place we leave the one road and pass under the management of the other.

THE MEETING OF THE ORIENT AND THE OCCIDENT—C. P. AND U. P. RAILROADS.

towns whence radiate lines of travel to the north and south, and whence come the results of busy industry from the bosom of the earth to enrich the world. Past Carlin, Elko, Halleck, Toano, and soon we enter a new territory,—one far-famed throughout the world,—Utah, the chosen land of the Latter Day Saints.

A Great Work and a Grand Celebration.

Before long, after having traveled some 800 miles from the Pacific Ocean, we reach the waters of an inland sea, Great Salt Lake. And while we are still slumbering soundly in our herths, we pass over a scene of a great work. For commencing some seven miles from Monument Station, between Lake and Rozel, the Central Pacific built ten miles of track in one day!

Since the completion of the road, the Union Pacific has changed its management, and is now under the charge of the first "railroad man" in our country,—the Honorable Thomas A. Scott. The attention of the East and of the West has lately been attracted to this gentleman on his being elected to the Presidency of the U. P., and there can be no question but that he will exercise a most powerful influence on the interests of our coast. The accompanying illustration will familiarize our readers with the features of one of the railway kings of the world, whose past history is being read with the greatest interest, and whose future actions are awaited with intense expectation, especially on our side of the continent. His management of the Pennsylvania Central R.R. and its associated lines is unrivalled in the records of railroad operations.

April 12, 1871.

A Rain of Frogs in Arizona.

With the July number of the *Overland Monthly* is commenced the seventh volume of this most excellent magazine, which we heartily recommend to our friends. Among its pages we find the following concerning a (to us) new product of Arizona.

The phenomenon familiarly known as the "rain of frogs" has been ridiculed and contradicted by certain scientists; nevertheless, there is abundant proof to show that it has occurred, and probably will again. In 1864, the writer, in company with some fifty other travelers had personal experience of the fact. We were in Arizona, not less than twenty miles from any stream, pond, or water. The day was extremely sultry, and we had halted to let the animals graze and rest for an hour or two. Not a living thing besides ourselves and horses was in sight, and certainly no frogs were hopping over the the rich, tufted *grama*-grass, which covered the ground for miles in every direction. Suddenly a dense, black cloud made its appearance, and it soon began to discharge a copious rain upon our unsheltered heads. The drops were very large, and the water quite warm. Nearly every person wore a broad-brimmed felt hat, which proved a great protection against the rain as well as against the sun. Our attention was soon arrested by the pelting of something which struck our hats like hail, but which proved to be frogs, and in less than two minutes the grass was fairly alive with those creatures. Several of the party took some from their hat-rims. Our unexpected visitors were all of one size, about a quarter of an inch long from nose to rump, very lively, and apparently in the best condition. Their fall had been broken by the springy, resilient nature of the grass. It is not probable that several hundred thousand, perhaps millions, of frogs had suddenly been hatched into life in the ground by the rain, or, if they had, that in their infantile glee they jumped five feet eleven inches from the earth to the top of our heads merely to show how the game of leap-frog should be played. Nor had they any such caudal appendages as are generally attached to juvenile *rana*. They came from above, in company with the rain; and this fact was made clear by holding out

the hand and seeing them fall upon it, as well as finding them on our hat-rims. The eggs from which these reptiles sprang, had undoubtedly been drawn up into the atmosphere by the action of a water-spout, and held in suspension with aqueous particles long enough to hatch them out and give them perfect form; then, by the force of mutual attraction, the separated particles of vapor got together in such masses as to form heavy sheets of water, which, in turn, became amenable to the law of attraction of gravitation, returning to the earth from whence it had been drawn. In the fall new divisions were created, called "drops," among which the frogs descended, having been, obedient to similar forces, moving with the aqueous particles. This instance is cited to show that other things besides vapor are translated from earth to atmosphere by certain well-known and accredited developments of natural laws.

A NEW CLASS of people, says a writer in the *Bulletin*, is needed in the foot-hills before they can be made use of for what they are worth—a class of persons who have

never been excited by seeing fortunes made suddenly, and who have not been subjected to the repeated failures of the hill stoics. Orange, fig and lemon orchards, walnut and almond groves, vines, etc., will be their common interest and support; a solitary fig tree ripening two or three crops, while grapes produce ten tons to the acre.

So let it be; but there is less imagination in, and more money just at present coming out of the gravel mines, which are good for 500 years to come.

The *College Courant*, an excellent paper always, is particularly good in the number of June 17. The article on the requirements of Yale University, by Prof. Dana, which was previously submitted to the professors, will interest all connected with universities. Published by C. C. Chatfield & Co., New Haven.

POPULAR LECTURES.

A Plea for the Study of English.

[Prof. SWINTON before the MECHANIC ARTS COLLEGE, Mechanics' Institute Hall, S. F. Seventh Series, Reported expressly for the PRESS.]

LECT. II. June 24.—When the Regents of the University of California, said the lecturer, prescribed the study of the English language as a leading duty of the literary professorship, they expressed a strong and growing tendency of the modern school. Up to within quite recent times the study of English has been very much neglected, and our students have been instructed in every tongue but our own.

The Study of English vs. Classics.

The lecturer did not wish to cast discredit on the study of the classics, nor to deny that it has very many advantages. He granted that it was of very great value as a means of mental discipline, and that it was a help and a key to a large part of our language. But he would vindicate the claims of our mother tongue, and, purposely abstaining from urging the practical reasons therefor, which are always able to make themselves felt, he would found his plea on these two points just mentioned—mental discipline and a help to understanding English—which are the main grounds of the advocates of the classics.

As to the latter point, the classics help us in our vocabulary in a great measure (but the same is true of the study of English) and do not help us at all in the grammar, in which the study of English has therefore the advantage. This will be illustrated hereafter. And as a means of mental discipline, why should not English serve as well as Latin and Greek? We shall get some important light on this matter by tracing briefly the steps which led to the study of modern philology.

The Study of Language Reveals Ancient History.

The first true beginning of the sound investigation of language was the discovery, at the beginning of this century, of a certain agreement of some of the European languages, as the German, etc., and the Latin and Greek, with a certain Asiatic tongue which is called the Sanscrit. This showed why the Latin and Greek resemble one another, and why the Teutonic also agreed in its roots, etc., with the classics;—because they were all of common descent. Then another step was taken, and it was found that the Polish, Russian, Welsh, Celtic and other European languages also had the same affinity, and that they all came from the ancient Sanscrit. This also demonstrated an intimate kinship of the speakers of these tongues; that the ancestors of the Germans, Celts and Slavons of the European nations, dwelt side by side somewhere in Northwestern Asia, at least 3,000 years before the Christian Era, and by the side of the ancestors of the Latins and Greeks and of the Asiatic tribes. This investigation is called comparative philology, and its immense value was first shown by Jacob Grimm.

The History of the English Language.

Now let us examine what the English language is, and trace up its history. We find that it has borrowed much of other languages in modern times, but this decreases as we go back. We find it strongly influenced by the Norman conquest, but yet a distinct language before this. We trace it back again to the Gothic, (Germanic), and, through the discoveries just alluded to, to the ancient Sanscrit. This last is a recent discovery, and one which is now causing an increased study of Anglo-Saxon, is giving much greater importance to the matter, and is teaching us very much concerning our mother tongue.

English Grammar an Absurdity.

The lecturer spoke at length concerning English grammar, a thing which at present does not exist. English has been called a grammarless tongue, which statement is only a rather emphatic statement of a pregnant fact. The English language is much older than the English grammar. In the 16th century, the scholars, in their learned ignorance, tried to fit to our tongue the Latin grammar. Hence sprung that hybrid—English grammar—to which we have been sacrificing, for 300 years, our children and the stranger within our gates. Prof. Swinton illustrated by examples the fact that Latin grammar is essentially foreign to English and cannot be adapted to it. Of the rules given in our grammars

very many are absurd and most are superfluous. If we are to have an English grammar—and the thing is by no means hopeless—it must be built up by the intelligent study of the language and not by forcing on to it rules by nature foreign to its very essence.

How Words are Made Up.

The lecturer spoke also at length of the vocabulary nature of our language, of the importance and interesting nature of its study. He gave several examples of the derivation and formation of words, of which we select a few.

FEARLESS is compounded of two parts or elements,—of the noun *fear* and of what is called the "formative element" (because it merely forms, by its addition, an adjective out of the noun) *less*. This last is not our word *less* but is the Anglo-Saxon *lease* which is our word *loose*. *Fearless* therefore means loose or free from fear.

BRAVELY is compounded of *brave* and the Anglo-Saxon *lic*, that is, *like*.

LOVED.—The termination *ed* of the past tense has long puzzled philologists. We get no light from the Anglo-Saxon, for it is used the same there as we use it. But the study of the Teutonic languages shows that it was an independent word. And the origin of this termination was found out through the discovery, a few years ago, in a Swedish library of the fragment of a translation made in the 4th century of the Christian Era of one of the gospels into Meso-Gothic, a language now dead. The Meso-Goths were a christianized tribe which dwelt on the lower Danube, and our termination *ed* is derived from *det* which is our *did*. *I loved* then means *I did love*.

The lecturer then spoke of the words adopted from the French and other languages in the course of time, and of how the engrafting of such had an effect in checking the inner growth of the language. We have not the space to do justice to his lecture, and are compelled to touch merely on some of the prominent points which he gave to show how interesting and important and useful is the study of our own language, and how it is valuable as a means of mental discipline and otherwise. He concluded with a eulogy of the purity and grandeur of English.

Strawberries on High Bushes.

A writer in the *St. Paul Press* affirms that he has seen scores of miles of country some sixty miles north of Fort Totten which was an almost continuous plantation of wild strawberries, growing in many of the rich spaces, not on horizontal vines, but on bushes, many of them three and four feet high, on which the clusters of this delicious fruit, attained a size rarely reached by the most assiduous cultivation. So profuse was this native production of strawberries, on what is called the Pembina Mountain, that the cart-wheels, crushing the berries as they revolved, were fairly red with this wild vintage of the plains, and left long crimson trails, as of blood, behind them.

Wild strawberries, he adds, are abundant in every part of the Red River valley; but on the fertile plateau known as the Pembina Mountain, remote from every human settlement, they grow with a luxuriance which is simply astonishing, and so far as we know, unrivalled. It is the only region where we ever met with the bush strawberry, but the plant there seems to take the upright in the very pride of its exuberant fruitfulness, as if it disdained to creep along the earth with its scarlet crown of glory.

MUSICAL SAND.—It is said that some six miles from San Buenaventura, Santa Barbara county there is "a marvelous deposit of musical sand." A mere step of the foot upon it gives off a slight musical sound; though to make it very distinct it is necessary to strike it a glancing blow with the foot or a staff. When that is done a clear, loud, musical sound, on the pitch of G, is given out, prolonged in a uniform sound as long as the staff or foot is in the act of passing through or over the dry deposit. We have traveled, for days, in the northern part of the State, where the loose stones upon the ground would give of a very strong musical sound at even a slight touch of the foot or a stick.

A PYRAMID OF GOLD.—A pyramid representing the quantity of gold produced in the Thames gold field, New Zealand, is promised for exhibition in the Mechanics' Fair of San Francisco, by A. Bryce Bain, (Honorable Secretary of the Thames Mechanics' Institute,) of Thames, N. Z.

GOOD HEALTH.

The Stomach.

That most wonderful organ, the human stomach, is very frequently troubled with an excess of acid; and when so troubled, the first thing that is naturally suggested, is a dose of some alkaline remedy, and down goes a teaspoonful of bicarbonate of soda or something of the kind, when a little thought upon the economy of the vital process would lead to a different way of arriving at nearly the same result. The saliva is known to contain free soda, and generally, if extreme substances were kept out, would be the proper corrective; but instead of properly masticating the food, it is too often washed down with a swallow of some liquid that contains the material for creating more acid, in that way rendering entirely useless the natural secretion; in other words, inserting a wooden cog in the wheel of refined steel, or its equivalent. And this is only one of many cases where the substitution of an artificial for the natural remedy works a finally irremediable evil; because eventually Nature becomes disgusted and refuses to supply the steel tooth we persist in replacing with a wooden one. F. M. S.

San Diego South, Feb. 20th, 1871.

Insolation or Sunstroke.

As the time when attacks of sunstroke are most frequent, is now approaching, it seems desirable to correct certain misapprehensions on the part of the public concerning the causes of this dangerous affection. It is commonly supposed that attacks occur only during exposure to the direct rays of the sun. But this is not so.

The Causes of Sunstroke

Are classified by medical authorities as predisposing and exciting causes, and of the latter, exposure to the heat of the sun is undoubtedly the most frequent; but the circumstance that attacks are common in sheltered situations, and sometimes actually come on in the night-time, shows that the direct action of sunshine is not alone responsible. Any vital vitiated condition of the system, arising either from living in a foul atmosphere or from dissipation, great fatigue, a lack of nourishing food, garments worn so tightly about the neck and chest that they restrain the free action of the parts, are all powerful predisposing causes, which, combined with exposure to great heat, are liable at any time to induce an attack. The influence of great fatigue in predisposing to an attack can hardly be overrated.

The experience of the British army in India is conclusive on this point. In the case of a particular body of troops obliged to make a hurried march of upward of eleven hundred miles during the hottest season of the year, all stood it well until some three-quarters of the distance had been passed, when the men began to exhibit unmistakable signs of fatigue in the shape of languor, loss of flesh, and failing strength. It was at this time that cases of sunstroke first appeared, and they continued with alarming frequency, coming on in the night as well as in the daytime during the remainder of the march.

Testimony from the same quarter concerning the bad effects of overcrowding and insufficient ventilation is equally explicit. It is remarked by Dr. Butler, that the men under his charge who, though not overworked or fatigued, were housed in crowded and badly ventilated barracks, were the ones who furnished the greatest number of serious cases. Out of sixteen cases mentioned by Mr. Longmore as occurring in a company belonging to his regiment, thirteen were attacked in barracks or in hospital. Insolation has also been frequently observed on board ship, most often where overcrowding and impure air were added to the influence of excessive heat. It is not uncommon on board the mail steamers in the Red Sea during the months of August and September, and it has been observed that most of the cases occurred while the sufferers were in the horizontal position in their well-ventilated cabins.

The Symptoms

Preceding an attack are in some cases scarcely observable, the person suddenly

falling in fatal syncope, and dying before assistance can be of no avail. More frequently, however, they are well marked, and, if early recognized, much may be done even by the non-medical to avert the serious consequences that might otherwise ensue. The more obvious symptoms are extreme heat and dryness of skin, often accompanied by a peculiar stinging sensation over the whole surface of the body, giddiness, congestion of the eyes, a sense of oppression about the chest, and a frequent desire to micturate. Contrary to the general opinion, headache is not a common symptom, though occasionally present. After a longer or shorter continuance of these symptoms, the patient becomes insensible, the heat and dryness of the skin increase, the respirations become hurried and labored, and unless remedial measures are speedily applied, death soon follows.

At the earliest moment after the attack, let the patient be carried to some cool shade where there is free circulation of air, his body stripped, and his face, neck and chest, freely donched with cold water. Continue this until the more serious symptoms, such as absence of consciousness, disturbed breathing, and great heat of skin are relieved, or until the arrival of some competent physician, who, on the discovery of the trouble, should at once be called. Cold water may be freely given inside as well as out, if the patient demand it. The causes of sunstroke previously enumerated will suggest the means to be adopted for its prevention.—*Galaxy*.

Little Causes of Death.

There is a time when a man is in such vigorous health, that it almost seems as if nothing could hurt him.

A young lady alighted from her carriage in the Central Park and stood upon the damp grass for half an hour, listening to the music of the band; her feet became cold, a chill struck through her system, and she died in a few days of disease in the throat.

Recently a lady from New York was visiting some of the interesting places in Rome; becoming weary, she sat on a stone bench for a few moments, and has been paralysed, from her waist down, ever since.

A person walks on a summer's day to some public exhibition or picture gallery; it feels refreshingly cool on first entrance, time passes unawares, when all at once an ugly chill runs down your back, and next day there is a cold which is to worry and annoy for weeks if not months. Very many, especially delicate ladies, "get their death" in this way, in visiting the picture galleries and public buildings of the Old World; the precaution should always on such occasions to have an extra shawl along, even in the hottest days of summer, to be thrown over the shoulders, and if the gloves are kept on, it is a great aid in preventing the system from cooling too rapidly.

It is a simple and a very little thing to take a bath. A young lawyer took a bath some years ago in this city; he stayed in too long, became chilled, and was a cripple all his days, for forty years afterwards.

Many a person has been found dead in the bath-tub, from attempting to enjoy that luxury too soon after eating. Never bathe, hot or cold, on a full stomach; the most perfectly safe time for taking any kind of bath is before breakfast, for then there is the least danger that the system is overheated, and then too it has the most vigor, the greatest power of retraction, the greatest ability of resisting the influence of cold.

It is usual for sea-bathing to be taken in the middle of the forenoon or afternoon; but considering the hot sun, sending its fiercest rays on the head, it will be wiser and safer to select the early morning.

BONE FELON.—Of all painful things can there be any so excruciating painful as bone felon? We know of none that flesh is heir to. As this malady is quite frequent and subject of much earnest consideration, we give the latest recipe for its cure, which is given by that high authority, the *London Lancet*:

"As soon as the disease is felt put directly over the spot a fly blister, about the size of your thumb nail, and let it remain for six hours, at the expiration of which time, directly under the surface of the blister, may be seen the felon which can be instantly taken out with the point of a needle or a lancet."

THE Oregon Insane Asylum, at the latest dates, contained in all one hundred and forty-one patients.

tion requires an extended answer, we
shall give an article on the subject at
the earliest opportunity.

F. H. Battle Mountain.—Communication
and package received. Will be noticed
next week.

J. M. of S. F. asks: Is there any such
thing as a cube mathematically exact?
Theoretically, yes; practically, no; if we
understand your question.

The End of Volume XXII.

With this number we close Volume XXII
of the SCIENTIFIC PRESS. During the past
half year we have had the most convincing
proofs of the increasing interest taken in
our work by our readers, and of the assist-
ance we have been able to render them in
their every day life. Our subscription list
has been very largely increased, advertise-
ments have come in rapidly, and the kindest
of letters and of notices have been re-
ceived from all quarters of the Pacific
coast.

We start on our next volume with better
auspices than ever. Only a few of our
readers have failed to renew their sub-
scriptions,—very few compared with pre-
vious years,—while large additions have
been made. Our expenses have also in-
creased, we may be allowed to state, as we
have added to the amount of matter given,
to the number of illustrations, etc. There-
fore we would ask our subscribers to send
in their dues as promptly as possible. And
so with many good wishes to our kind
friends, and with the request to all to read
the paper and judge us by our works, we
end Volume XXII and commence with Vol-
ume XXIII.

ANTIOCH RAILROAD.—The Antioch *Led-
ger*, of June 24th, says that eastern capi-
talists are engaged in an enterprise which
promises the building of the Antioch and
Visalia R. R.

A NEW HAVEN gentleman recently re-
covered \$375 for a tres spoiled by gas from the
New Haven Gas Co.'s pipes.

The Strike at Sutter Creek.

The strike, last week, at the minns of
Sutter creek, is one of the most deplorable
events that have happened of late in our
mining industry. This matter has been one
of the absorbing topics of the day, notwith-
standing the meeting of political conven-
tions, and the strike seems to meet with
no sympathy whatever from those not con-
nected with the movement.

While it is rather difficult to arrive at
the precise stats of affairs and the reasons
leading to the strike, yet the following
seems to be authenticated by the best au-
thorities.

First. The strike is not one of the min-
ers, properly speaking, but has been
brought on and is now sustained by out-
siders parties, by demagogues who thus seek
to benefit themselves to the injury of the
working men. Thus, when Governor
Haight addressed the miners in the hope of
effecting a compromise, one Eagan, County
Supervisor, (not a miner) is reported as
having made an inflammatory and insult-
ing speech in reply, rejecting all terms on
his own authority, irrespective of the
wishes of the miners.

Second. The avowed purpose of the
striks was to place unskilled and skilled
labor on the same footing,—a direct injury
to the good workman, and a most unjust
thing.

Third. The strike was carried out con-
trary to the wishes of the majority of those
directly interested,—the working popu-
lation. Most of the miners are reported as
satisfied with the prices paid, which are
the same as those which have ruled for a
number of years past. There was no re-
duction attempted on the part of the com-
panies owning the mines.

Fourth. Instead of merely quitting work,
the strikers have attempted to put the mines
in such a condition as to destroy all
hopes of working them hereafter. There-
fore, instead of benefitting themselves,
they injure both sides.

Under these circumstances, we cannot
but pronounce the "strike of the dema-
gogues" (we will not insult our miners by
calling it the *miners'* strike) as most un-
justifiable and wrong. These demagogues
have succeeded in persuading the foreign
population, who are naturally less able to
understand the true relation of affairs than
people well acquainted with our language,
that they have been wronged. By ap-
pealing to them in the most unfair man-
ner, they have succeeded in working the
greatest injury to the laborers themselves
and to their employers. We most sincerely
hope that these wicked leaders, who seek to
enrich themselves at the price of misery
and suffering on the part of the miners,
may be speedily brought to justice.

Our sympathies are strongly with the
working men, and we grieve that they
should have been led astray by designing
loafers. We advise them for their own
interests to throw such persons aside and
to be guided by their own better judg-
ment. They must see that, without the
influx of capital to the mines, there can be
no employment at all for them, and that
the whole country will be so much the
poorer. Capital must be protected, or it
will go where it can find protection. We
are as strongly opposed as any one to the
oppression of monopolists; but every one
must grant that capital is absolutely nec-
essary to the development of our country.

CROFUTT'S TRANSCONTINENTAL GUIDE.—
The publishers of this work—the best and
most complete guide book published in
America—furnishes numerous illustrations
of the rarest scenery on the line of the
Union Pacific R. R., and the C. P. R. R.,
a few of which views he has consented
that we should reproduce in our paper.
Two appear with our "Editorial Notes" in
this issue. Crofutt is entitled to much
credit for his liberal enterprise, and every
tourist should buy his book, no matter how
many other guide books they possess.

Patent Office Matters.

New Publication of Patents, etc.

A late visit to the U. S. Patent Office,
after an intervening space of three years,
shows much improvement in the arrange-
ment of affairs inside, and that business, in
many particulars, is transacted more guard-
edly and rapidly.

We wish our government in all such im-
portant departments would cease its folly
of changing its experienced servants peri-
odically, for political reasons alone—a
practice expensive, annoying, and be-lit-
tling to our national reputation.

Publishing Patents in Full.

In a brief conversation with the Com-
missioner, Gen. Leggett, we learned that
after the 1st of July next, all patents is-
sued will be printed separately, in pamph-
let form, with the drawings, and sold at
ten cents a copy. The size of the pages
will be about 5 by 9 inches, or what is
termed in the office "bill size." The pres-
ent prices of printed copies varies from
50 cents to \$1.50.

Free Copies to Inventors.

An important circumstance for inventors
in this change is the fact that the office,
with much generosity, proposes to send
every applicant for a patent, whether his
petition is allowed or not, copies of all
patents issued for the ensuing six months
in the class in which his invention is
placed. In some large classes this will
give inventors an abundance of printed
paper with much information that they are
directly interested in.

Distribution of "Public Docs."

This plan will effect a wiser distribution
of the government's printing ink and papers
than the old way of handing over to Con-
gressmen the huge list of patent claims,
with insignificant drawings, to be sent to
their relatives of various grades, and
political friends indiscriminately, [all of
whom can vote, and, at least, make their X
mark]. Some are used in filling up still-
born book cases; other copies afford a few
days amusement for the children, and a
majority are finally used for lighting fires,
or exchanged for wares with the tin ped-
dlers who buy old rags and paper stock.

We are glad to see this move in a good
direction, although we do not think it will
prove a full success to send out the printed
patents free in the way intended. It
would be better, in our opinion, to send
none to anybody unless solicited, but allow
everybody to order copies of any class of
patents for a nominal price, say one cent
per page, which would more than pay the
cost of printing in large numbers. We
thank Commissioner Leggett for this ac-
tion, however.

A Much Needed Publication.

Colonel Leggett gave us a very correct
opinion of a publication now most wanted
by inventors and others, viz., a work which
reviews the patents and inventions already
made in each class and division, showing
the present attainments, whereby persons
interested in certain kind of inventions
may readily obtain the information they
specially desire without purchasing and
being inconvenienced by voluminous pages
of no value to them whatever. Such a work
on American patents, given in bound
volumes up to the present time, and the re-
view continued in frequently issued pamph-
lets or circulars, for each division, so that
each class could be subscribed for sepa-
rately, would, in our opinion, become im-
mensely popular and well patronized.

The capital city—headquarters of the
great department—with its numerous
solicitors, is noted for no periodicals by in-
dividuals for the benefit of mechanics and
inventors.

I have had interesting and pleasant in-
terviews with the officials in the various
offices in the patent office, and have heard
many plainly spoken compliments for the
more than usual originality and ingenuity
manifested by our Pacific coast inventors,
towards whom a liberal feeling seems to
prevail. The ready and just attention
which our clients' applications have lately
met, and the satisfaction universally ex-
pressed at the department in regard to the
complete preparation of our cases, afford
much gratification in return for our long
diligence in doing our duty conscientiously
and fully towards a noble class of patrons,
i. e., "INVENTORS."

Washington, June 3d, 1871.

"Casting Iron Pipe Like Bullets"

Such is the expression descriptive of
the new process just introduced at the
Pacific Iron Works of Goddard & Co., and
only brought into full blast this week.
The amount of work of this description
going on at this foundry is enormous, oc-
cupying three foundries, the Pacific and the
ones adjoining, and the late Brodie Foundry
which has also been purchased and fitted
up exclusively for making pipes by this
new process. From 15 to 20 tons of iron
are now melted daily for this purpose and
to carry on the ordinary business of the
above firm.

This process is new in the East as well as
here; it consists in the use of a mold or
flask of cast iron, in three parts, so ar-
ranged as to be used over and over again,
as a bullet mold is used in casting bullets;
instead of the common mold which re-
quires fresh modeling in founders' earth
at every casting. The inside of the mold
is coated with a preparation of fire clay
which effectually resists the action of heat,
over 600 having been made from one
flask without relining.

From six to eight castings are thus made
at every heat from one flask. After a
flask is poured, it is immediately opened,
the pipes taken out and a new core put in,
when it is ready for another pour.

The above process has been patented by
Messrs. Farrar & Whiting of Boston, and
the exclusive use of it for this coast has
been secured by the proprietors of the
Pacific Iron works. Whiting's Foundry
in Boston has been using the process for
the past six months with great success.

The application of this invention cre-
ates another new industry in our midst,
making it possible now to compete with
Eastern shippers in the production of cast
iron pipe. But the size practicable ranges
only from 3 to 10 inches in diameter.
Heretofore all such pipe has been shipped
from the East, none having been made on
this coast before Goddard & Co. com-
menced it this spring. It is used for
water chiefly, and gas.

The principal contract is that of the
Metropolitan Gas Co. for whom Goddard
& Co. have made to this time upwards of
7,000 feet of one size; the total contract
consisting of some two miles of 16 in.
main, and some 10 or 12 miles altogether,
of various smaller sizes.

The rate of production is about 100 ft. a
day of 8-inch pipe; but this will be in-
creased to 500 or 600 ft. of the various
sizes from 3 to 10 inches in diameter.
The large (16in.) main pipe has to be
made in the old way, but the work is be-
ing done also with an improved mold; the
thickness being nine-sixteenths of an inch,
suitable for a pressure of several hundred
feet head.

Water Delivering Facts—Pipe and Pressure Limits.

To set forth in brief what has been done
in a few well-known instances in Califor-
nia, in connection with suggestions origin-
ating in hydraulic mining, will be the
most appropriate means of supporting our
claim for having contributed new and
some most valuable additions to the sci-
ence of practical hydraulics. The neces-
sity for carrying water over or through
the greatest obstacles—over mountains and
across sheer gulches of 900 feet in depth,
up again on the opposite side, and so to
the locality where the water is needed, was
the engineers' incitement; the object, gold,
for the world's most urgent cry and de-
mand; the results being a solution in
the following facts, which are contributed
for the use of engineers and practical men.

I select from sections furnished by
Mr. Moore, of the Risdon Iron Works,
under whose hand and judgment the lead-
ing works of this sort, in the State, have
been executed, three leading ones, viz.,
the great Cherokee hydraulic mining pipe
in Butte County, the Spring Valley main

pipe from the San Mateo mountains to San Francisco, and one Spring Valley feeder; to which is appended a tabular statement of the dimensions of these and other pipes in actual present use, with facts touching durability, etc.

The Cherokee pipe is over two miles long, and has over 900 feet head and pressure; the Spring Valley is 14½ miles long, and has in several places over 300 feet, and in one 350 feet, pressure; and the pipe at Chinese Camp (not represented above) is 9,000 feet, or 1¾ miles, long, and has 800 feet pressure.

The thickness of iron gives a basis for computing the comparative cost of cast

out \$1,000 of gold per day. Quite a number of other similar new enterprises could be mentioned in this connection, were the subject in place; that at Cherokee involving, *en passant*, also a tunnel for outlet, which will require five years to run.

To make use of the above figure, the method would be: that if a 23-inch pipe for example, stands so much, a 12-inch pipe, or any other required, ought to bear so much less; the rule being that where the diameter is the same, the thickness of iron is as the height; or, where the height is the same, the thickness is as the diameter.

Examples of Durability.

1. Smartsville pipe, 16 in. diameter to

size of iron, and the distances between them, for both the longitudinal and the round seams:

No. of Rivets	Diam. of Rivets	Distance between the Rivets.		Round Seams
		Long. Seam double riveted.	Vertical.	
14	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
12	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
11	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
10	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
9	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
8	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
7	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
6-16	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
5	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
4	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
3	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
2	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.
1	1/4 inch	1 1/4 inch	1 1/4 inch	1 1/4 in.

Cast iron has some advantages over wrought iron. While weighing more, it will last from three to ten times as long, the iron being, for some unknown reason, less liable to oxidation. It is, when

the moving train is equal to ten or twelve miles per hour, the ends of the bodies of such cars are liable to be broken, and the cars to pass into and through each other. This is "telescoping" the cars.

In a previous number of the Press, we described the Miller Trussed Platforms, Compression Buffers and Automatic Couplers, which are claimed to prevent any liability to this class, as well as other classes, of accidents, and which are certainly in the highest repute among railroad men. The following cuts serve to show the principle of telescoping, how it is caused by faulty construction, and how it is prevented by correct construction. They likewise show the principle of the Miller platform.

Fig. 1 shows how telescoping can occur

iron and of wrought iron pipe; ¾ wrought iron sustaining a pressure of 385 pounds to the square inch, for which 3-inch cast iron (nearly) would be necessary for safety.

A, carries 3,000 miners' inches with the head it has. The whole line of B is working perfectly, the limit run to being about half the pressure of the Cherokee pipe, arising from a necessity for a greater degree of safety.

The circumstances connected with the discovery of the practicability of such enormous heads in large conduit pipe, made of sheet iron, arose from the fact that in the engineers' formulas, and in practice everywhere, the tested safe pressure has always been accepted as the axiom; that is, the pressure a boiler would bear per square inch, for example, without danger of explosion; but it was found necessary in connection with mining conditions, such as freightage in the mountains of California, to use thin, portable and cheap pipe; on which, in hydraulicing,

18 iron, not painted inside, painted outside, 180 feet pressure, laid 1861-10 years.

2. Smartsville, 40 in. diameter, 3-16ths

iron, with ¾ alternately; 2,200 feet long, coated outside, laid 1861-10 years.

3. San Juan, 36 in. diameter, No. 12 and 14 iron, coated inside and out; pressure 55 ft.; running 10 years; estimated at 20 yrs.

broken, worth one cent per lb., while wrought pipe iron is not worth cutting up in California. Anything above 16 or 18 inches would in all cases be better wrought;

24 to 30 inches of cast iron would be too expensive.

The city distributing pipes of the Spring Valley Co. are of cast iron; usually about ¼ of an inch in thickness, which is four or

with the old construction. A A, are the car bodies; B B, the sills of the cars; c c, the platform sills; D D, the drawheads, which serve also as buffers; E, the coupling link; f f f, the center line of the sills of the cars; g, the point of contact; and h g, the line of depression from the center line, f f f, to the point of contact, g.

These platforms are located below the sills of the cars, and the buffers far below the platforms, bringing the point of contact at g, instead of f (directly above g). This crook in the line, f h g, will cause a broken platform, in a collision. The result is shown in Fig. 2. One car is raised up, by the broken platform, and made to strike the opposite car above its sills, where nothing but light studding and paneling is encountered in its course into and through the same.

Fig. 3 shows the proper method of construction of car platforms and the application of the coupling and buffing apparatus which accords with mechanical laws. Here A A are the car bodies; B B, the sills of the cars; c c, the platform sills; D D, a method of coupling without link or pin or substitute therefor, entirely automatic in its operation, and capable of being attached to any other kind; E, the buffer, located in the center-line, f f; g g, the course of the

a higher and higher head was gradually used—since no great harm could result from bursting—until the limits became pretty well established amongst miners at a far higher figure than was ascribed to iron for other purposes.

Spring Valley being near San Francisco and in a populous county, the risks of damage from bursting would be far greater than in the mountains; it is for that reason that the Spring Valley pipe is made so much stronger, as seen in the table.

In proof of the utility of investments in pipe for mining, the Cherokee water used in one mine, is at the present time washing

4. Chinese Camp, 11 in. diameter, delivering 300 miners' inches, Nos. 12, 14, 16 and 18 iron; 9,000 feet long; 800 feet pressure; laid in 1868-2 years.

5. Cherokee-6 months.

The fractional expressions designating pipe or sheet iron are fractions of an inch; the numbers, as "No. 9 iron," refer to the English ironmongers' gauge, an arbitrary system of designation, in which No. 11 is, for example, about equal to ¼ of an inch in thickness.

The following table gives items of importance concerning the riveting of the seams, the diameter of the rivets for each

five times the quantity of iron that would be necessary if the same were wrought instead of cast.

Telescoping.

One class of railroad accidents which has the most fearful effect on the mind, is telescoping—the running of cars into each other like the joints of a telescope. Any sudden checking of a passenger train in motion may, and too often does, under the old system of platforms, couplers and buffers, break off the platforms of the cars and permit the ends of the car bodies to come in contact; and if the speed of

truss rods that hold the platform in the line of the sills of the cars.

This shows the straight line method of buffing, which ensures that a platform cannot be broken off by a collision, as is possible with the previous construction.

The two methods may be plainly illustrated by taking a cut nail and bending it, as at N, Fig. 1, to correspond with the line, f h g, Fig. 1; this crooked nail cannot be driven into a soft pine board; a light blow with a hammer will break it, as shown at O, Fig. 2; while a straight nail—as P, Fig. 3—may be driven with hard blows into the hardest kind of wood.

This is the way in which Col. Miller shows the superior construction of his inventions. Letters to him may be addressed to E. Miller 231 Broadway, New York City.

Miscellaneous.

Of a far Higher Class than any other proprietary
medicine of the day stands

Tarrant's Effervescent Seltzer Aperient,
And for this reason, it is an exact counterpart of one of
the most valuable medicines in the world. We refer to
the great Seltzer Spring of Germany, to which thousands
of the dyspeptic, the bilious, the rheumatic, and the
victims of venal diseases resort annually, and return to
their homes convalescent or cured. The Aperient is
one of the first, and by far the most successful, of all
the efforts made to reproduce, in a portable form, the
popular mineral waters of Europe. SEE THAT YOU
PURCHASE ONLY THE GENUINE ARTICLE.
SOLD BY ALL DRUGGISTS.

The "PAIN KILLER" may justly be styled the great medi-
cine of the world, for there is no region of the globe into
which it has not found its way, and been largely used and
highly prized. Moreover, there is no claim to which it has
not proved to be well adapted for the cure of a considerable
variety of diseases; it is a speedy and safe remedy for burns,
scalds, cuts, bruises, wounds and various other injuries, as
well as for dysentery, diarrhea, and bowel complaints gen-
erally, it is admirably suited for every race of men on the
face of the globe.

It is a very significant fact, that notwithstanding the long
period of years that the "Pain Killer" has been before the
world, it has never lost one whit of its popularity, but on the
contrary, the call for it has steadily increased from its first
discovery, and at no previous time has the demand for it
been so great, or the quantity made so large, as it is
to-day.

Another significant fact is, that nowhere has the Pain
Killer ever been in higher repute, or been more generally
used by families and individuals, than it has been here at
home, where it was first discovered and introduced. That
the Pain Killer will continue to be, what we have styled it,
THE GREAT MEDICINE OF THE WORLD, there cannot be the
shadow of a doubt.—*Providence Advertiser.*

WALTHAM WATCHES.

In soliciting anew the public patronage of WATCHES of domestic production, the AMERICAN WATCH COMPANY respectfully represent:

That no fact in the history of manufactures is more completely demonstrated than that the best system of making Watches is the one first established by them at Waltham. That system always had the warrant of reason and common sense, and now the test of time in the trial of the Watches themselves cannot be denied to have been ample and satisfactory. It is admitted on every hand—the evidence of daily observation and common repute—that the Watches not only keep correct time, but that as machines they ENDURE. It should seem that nothing more is needed, but that their sizes, shapes and appearance should suit the tastes of the people. As to all these conditions the American Watch Co. are now fully prepared to answer the exacting of the market. They confidently assert there is no longer any need for such reasons to import watches of any description whatever. Every size in ordinary demand, every shape and every variety of finish and decoration, may now be had. And as to price, the recent reductions leave no room for doubt that the Waltham system of Watch-making is

The Most Economical as well as the Most Reliable,

And that the Waltham Watch is the Cheapest as well as the Best.

Many new varieties of movements have been added during the last year, all of which display the Latest Improvements in design and finish, and evince the rapid progress the Company is making toward perfection in the art. Among these the new small size Watch, for Boys and young gentlemen, is to be especially noted. A very low price has been made for this Watch because it is a boy's watch, and with the object of bringing it within the means of boys of all classes. Price being considered,

No such Watch, in Quality and Beauty,

Has ever, in any country, been produced.

The "CRESCENT-STREET" FULL PLATE WATCH, added during the last year, is now made either with or without stem-winding and setting attachment. This Watch, in either form,

The Company Challenges all Manufacturers of all Countries

To heat or equal for its price. It is made with all the latest improvements in every part—improvements which improve—and which not only make it better for its purpose as a timekeeper, but will make it the great favorite with Watchmakers. This, the highest grade of full plate Watches made in this country, in size and appearance, in finish, and general excellence, is especially intended for and recommended to business men, and in particular to Railway and Expressmen, to constant travelers—in fact, to all live men who must be told by their Watches the correct time of day whenever they want it. All such men should have the

"American Watch Co., Crescent Street."

Counting on such destination for this variety of their manufacture, the company devote the greatest care to its construction, employ upon it only their best men and best machinery, and issue it with their reputation at stake upon its success.

For sale by all leading jewelers. No Watches retailed by the Company. For all other facts address

 HENRY CAREY BAIRD,
 Industrial Publisher, 406 Walnut St.,
 Philadelphia.

PSYCHOMANCY.—Any Lady or Gentleman can make \$1,000 a month, secure their own happiness and independence by reading Psychomancy, Reasonation or Soul Charming, 400 pages. Full instructions to use this power over men or animals at will, how to Memorize, become Trance or Writing Mediums, Divination, Spiritualism, Alchemy, Philosophy of Omens, and Dreams, Brigham Young's Harem, Guide to Marriage, &c.; 200,000 sold. Sent by mail in cloth for \$1.25, paper covers, \$1.00. The Philadelphia Star speaking of the book says it is a sufficient guarantee of the merits of the work. Mrs. Evans has spent \$50,000 already in advertising and getting out this extraordinary book. Skeptics in Psychology read and be convinced of this wonderful occult power.

NOTICE.—Any person willing to act as Agent will receive a sample copy FREE. As no capital is required, all desirous of genteel employment should send for the work, enclosing 10 cents for postage, to T. W. EVANS, 43 S Eighth street, Philadelphia, Pa. mad-jan3t

MARAVILLA COCOA.—No breakfast table is complete without this delicious beverage. The *Globe* says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Coconos, but we doubt whether enough success had been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Coconos above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers, Original Homoeopathic Cocoa, and Soluble Chocolate, Steam Mills—Briek Lane, London. Export Chicory Mills, Bruges, Belgium. fe25-1y

Dewey & Co., U. S. and Foreign Patent Solicitors and Counsellors, Scientific Press Office.
Principal Agency in the Pacific States. Established 1860.

And in accordance with law, and an order of the Board of Trustees made on the 23d day of May, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at the auction room of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Wednesday, the 19th day of July, 1871, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID WILDER, Secretary.
Office, No. 28 Merchants' Exchange, California street,
San Francisco, Cal. 26v22-3t

Eagle Quicksilver Mining Company—Location of works, Santa Barbara County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 14th day of June 1871, an assessment of twenty dollars per share was levied upon the mines of said Company, payable immediately in gold coin of the United States, to the Secretary, at his office, Room No 5, No 302 Montgomery street, San Francisco, California.

Any share upon which said assessment shall remain unpaid on Wednesday, the 9th day of August, 1871, shall be deemed delinquent, and will be duly advertised August 12th, 1871, for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 14th day of August, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary.
Office, Room 5, No. 302 Montgomery street, San Francisco,
California. 26v22-3t

Kincaid Flat Mining Company—Location of works, Tuolumne County, State of California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the 28th day of April, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Am't.
S. Card.....	10	10	\$25 00
S. Card.....	39	5	12 50
Wm. H. Sharp.....	35	10	25 00
Wm. H. Sharp.....	36	10	25 00
N. Gardner.....	104	5	12 50

And in accordance with law, and an order of the Board of Trustees, made on the 28th day of April, 1871, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Kincaid Flat Mining Company, 220 Clay street, San Francisco, Cal., on the 1st day of July, 1871, at the hour of 10 o'clock a. m., to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

N. C. FASSETT, Secretary pro tem.
Office, 220 Clay street, San Francisco, Cal. Jun-10-4w

Marcelina Silver Mining Company—Location of works, Eureka District, Lander County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, of said company, held on the 2d day of June, 1871, an assessment of twenty (20) cents per share was levied upon the capital stock of said company, payable immediately in U. S. gold and silver coin, to the Secretary, Room 21, Hayward's Building, 419 California Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the 11th day of July, 1871, shall be deemed delinquent and will be duly advertised for sale, at public auction, and unless payment shall be made before, will be sold on Tuesday, Aug. 1st, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHAS. E. ELLIOT, Secretary.
Office, Room 21, Hayward's Building 419 California Street, San Francisco, Cal. 23v22-4w

Sierra Iron Company—Location of Works, Sierra and Plumas Counties, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the 17th day of May, 1871, the several amounts set opposite the names of the respective shareholders, as follows:

LEA & PERRINS'

CELEBRATED

Worcestershire Sauce.

Declared by Connoisseurs to be the only good
SAUCE. The success of
this most delicious and
unrivalled Condiment
having caused certain
dealers to apply the
name "Worcestershire Sauce" to their
own inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their name
is upon the wrapper, label, stopper and
bottle.

Some of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and label
of which the names of Lea and Perrins have
been forged, and for export by the Proprietors, Worces-
ter, Cross and Blackwell, London, &c., &c., and by
Grocers and Oilmen universally. Agents, CROSS &
CO., San Francisco. 1v22-lycwo

WHY THE WILSON

Patent Steam Stamp Mill

IS THE BEST AND

Most Desirable Mill for Crushing Ores.

Because the company give a responsible guarantee that the purchaser shall be under no expense for repairs for TWELVE MONTHS, and guarantee the mill to crush (regular work) One Ton Per Hour of the Hardest Quartz through the ordinary screens.

THERE IS A SAVING

of from Twenty to Forty per cent. running expenses.

To put one of the Wilson Mills over the mountains, from \$10,000 to \$18,000 is saved in First Cost.

The Wilson Mill will save in working expenses and repairs enough every six months to PAY FOR ITSELF.

IN EVERY PARTICULAR

This Mill is Greatly Superior to the

Ordinary Cam Stamp Mill.

RECOLLECT

This Mill is Fully Guaranteed

to do and be all we claim for it.

DO NOT BE DECEIVED

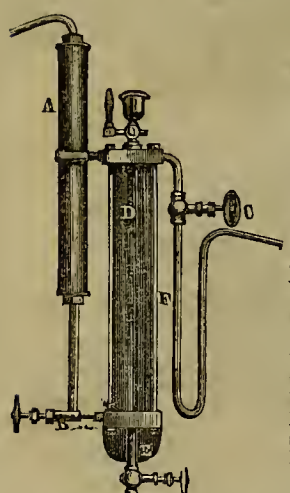

by the cry of "Humbug," but call and investigate its merits. One can always be seen at the Pacific Iron Works.

Ten of these Mills are now in operation. For further particulars address

FURMAN R. WILSON,

San Francisco.

GARRATT'S CONDENSING LUBRICATOR,

Or "TALLOW CUP." This is a California Invention, and the BEST and Most Economical Lubricator in use. It keeps cool, and its operations are very readily observed. Send for Circular to W. T. GARRATT, Cor. Mission & Fremont streets, San Francisco.

DESCRIPTION:—D, is a glass chamber which contains the lubricant. C is a valve, connecting with pipe which introduces the lubricant into chamber D. F, is the discharge pipe for the lubricant, provided with an inverted syphon to prevent steam from coming back from the steam chest or steam cylinder into the instrument. E, a waste pipe and valve for drawing waste water from the oil chamber before discharging the same. B, a valve and pipe to introduce water under the lubricant for the purpose of expelling the same; this pipe is connected to the boiler or steam pipe therefrom. A, is a steam condensing pipe or vessel, to provide a full supply of clean and pure water for the injection of the lubricant from the oil chamber; the rapidity of action being regulated by the valves B and C.

41 First st., San Francisco.

THE HESSE GRINDER AND AMALGAMATOR.

This machine is the most complete and desirable grinder and amalgamator now in use. Owners of Quartz Mills and Sulphuret Works will find it greatly to their interests to use this machine. The following are some of its many advantages, viz: The comparatively little power required to run it; the small wear of metal in comparison with other grinders; the large amount of work that may be accomplished in a given time, being about three times the amount usually performed in ordinary pans; the continuous working process, whereby the labor of handling the ore is avoided; the peculiar arrangements and action of the currents in the machine, whereby all the particles of ore are brought in contact with amalgamating surfaces, and are discharged as soon as ground to the required degree of fineness, thus saving an unnecessary waste of power and metal.

IN THE REDUCTION OF SULPHURET ORES,

this machine is especially valuable, the particles are ground exceedingly fine and uniformly sized, which greatly facilitates the concentration of the sulphurets, and leaves them in the best condition for roasting. The Hesse machines are successfully working in several important quartz mills and sulphuret works in this State. For further particulars send for Circular, or apply to

THE PATENT

Novelty Mill and Grain Separator

Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a first-class Fanning Mill. It also far exceeds anything that has been invented for the separation of Grain. It has been thoroughly tested on all the different kinds of mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct quantities of wheat if desired.

For further information apply to R. STONE,

25v22-3m

422 Battery street, San Francisco.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely dissolved.

Millmen are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

AHEAD OF THE WORLD.

THE NEW TREADLE POWER,

Just Invented, and used exclusively on the HOWE SEWING MACHINE.

With it any lady, however delicate her health may be, can run the Machine from morning until night with perfect impunity.

The Howe is the Best,

Consequently the most Popular Machine in use. The Daily manufacture is over 500 Machines.

H											

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which can be found elsewhere in print. It abounds throughout with facts and illustrations rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postpaid.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

For single copies of the above works, or for the trade,

San Francisco.

Sam F. Hunsicker

PACIFIC RURAL PRESS

THE PACIFIC RURAL PRESS is a fine, large paper, and promises great things as an agricultural paper—the finest in the State. Success attend it.—*Pajaronian*.

It is the duty of the farmers to sustain it, and try and make it a success, which we believe will be done. The price per annum is \$4.—*Yolo Mail*.

Its selection cover a great variety of subjects and contain the latest discoveries and suggestions in the field which it occupies.—*Stockton Independent*.

One new feature of the Press is a weekly leather market report, which will be found to be of interest to all leather dealers, harness makers and shoe and boot makers.—*Independent*.

THE PACIFIC RURAL PRESS is one of the Largest, best Illustrated and most Original and Entertaining Agricultural Journals in America, and has no rival on this side of the Continent. Its Circulation is Rapidly Increasing, and it is Very Popular with its Patrons.

It is crammed full of Hints and Information for the Progressive People of the Pacific States, which are more Profitable and vitally Interesting to our Husbandmen and Industrial Classes than any which can be obtained elsewhere. Subscribe at once for your own Pleasure and Profit.

PACIFIC RURAL PRESS.—It is a sixteen-page sheet, and presents a very beautiful appearance. Such a paper has been in demand on this coast for some time, and we judge from the amount of agricultural information which it contains that it fills the bill. We notice that I. N. Hoag, of Yolo county, has been selected as one of the contributors to its pages. Every farmer should subscribe for it.—*Yolo Mail*.

NEW AGRICULTURAL PAPER.—THE PACIFIC RURAL PRESS.—It is truly a model agricultural paper broad and comprehensive in its scope, ably edited, and will mark a new and better era in the history of agriculture on this coast. It cannot be supplanted by any agricultural paper published in the East, for the editors are men familiar with the soils and climatic peculiarities of this coast.—*San Jose Mercury*.

THE PACIFIC RURAL PRESS.—As its name indicates it is devoted to agriculture in all its branches, and the sample number is filled with matter invaluable to farmers, gardeners, and stock raisers. No man taking any interest in farming, gardening or stock raising ought to be without the PACIFIC RURAL PRESS. It is well worth the subscription price—\$4 per year.—*R. R. Reveille*.

"PACIFIC RURAL PRESS".—The PACIFIC RURAL PRESS of Saturday, which has just come to hand, contains a great amount of matter which will be of interest to farmers, manufacturers and mechanics. The subscription price—\$4 per annum—is certainly a trifling sum for this model paper—devoted as it is to the best interests of the farmer on the Pacific Coast. We predict success to the Press.—*Independent*.

TAKE THE NEW HOME PAPER!

Will be issued weekly on Saturdays, commencing Jan. 7th, 1871, containing sixteen pages devoted to

Agriculture, Horticulture, Stock Raising, Domestic Economy, Home Manufactures, Mechanics, Industries, etc.

With an able and ample corps of editors, special contributors and correspondents, we publish a liberal variety of articles, entertaining as well as instructive, which not only make the **RURAL PRESS** an able assistant to its patrons, but an attractive and welcome visitor to every reader in every intelligent

Home Circle;

for few there are—male or female—who will not find pleasure and enjoyment in the study of progressive farming and gardening.

Honest, intelligent and correct information is faithfully given, in behalf of, and urging

An improved Cultivation of the Soil;
A greater Diversity of Products;
Better Breeds of Stock;
Better Varieties of Fruits;
The Culture of New Products;
Creation of New Home Industries;
Adoption of Improved Implements;
Higher and Happier Aims in Life, etc.

Valuable and Timely Hints,

are given weekly to lessen the labors of the farm, the household and the shop, and add to the health, the wealth and the wisdom of every patron of industry.

How to Farm in the Pacific States.

As the conditions and circumstances of soil and climate and seasons on this coast are so peculiar that many of the approved methods of eastern agriculture are not at all applicable on our side of the Continent,—special attention will be given to considering the need, extent and character of the modifications necessary. This will alone render the paper of great practical value to our home readers and more essential to them than all the distant publications obtainable, without such auxiliary and modifying instructions.

The following are among the specialties upon which the **PACIFIC RURAL PRESS** will treat:

Silk, Cotton and Sugar Beet Culture; Nurseries, Orchards, Tropical and small Fruits; Steam-plowing, seeding and harvesting for large tracts; Reclamation of swamp and unproductive lands; Hill and mountain farming; Grape growing; Fig, Raisin and Fruit drying; Irrigation; Lessons and Lectures on the chemistry of growing crops and on fertilizing lands; Practical Farming vs. Speculation; Taxation of unimproved lands; Railroads and improved transportation for crops and the better class of immigrants; Farmer's Clubs, lectures and associations; Co-operation in farming, mechanism, manufacturing and other industries; Government lands for settlers whether sold by R. R. operators or the U. S.; Reliable wholesale and retail market reports; Brief notices of Mechanical and Scientific Progress; Instructions for regular and farmer mechanics; Household Reading; Health and domestic receipts; a sprinkling of sprightly reading; Life thoughts; Poetry, condensed stories, items of news, etc., will be given.

No editorials or selections of unchaste or doubtful influence; or lottery, quack or other disreputable advertisements, will be admitted into its columns.

SUBSCRIPTION IN ADVANCE.

One copy one year.....\$4 00
One copy six months.....2 50
One copy three months.....1 25
Single copies.....10

CLUB RATES.

Ten copies or more, first year, each.....\$3 00
[A free copy or premium sent to getter up of club.]

A select variety of advertisements only will be inserted. Circulated widely among the most thrifty of our population, the **P. R. P.** will be the cheapest and most effective medium for a large range of first class advertisements in the Pacific States.

Correspondence is respectfully solicited from every worthy source.

LOCAL CANVASSERS WANTED for every town, city and county. Special inducements offered. Parties desiring to get up clubs or act as agents, will be furnished sample copies and prospectus free.

DEWEY & Co.,

Publishers Patent Agents and Engravers, No. 414 Clay st., San Francisco. Nov. 21, 1870.

A CARD.

DECEMBER, 1870.

Having seen the prospectus of the **PACIFIC RURAL PRESS**, and believing there is great need in our comparatively new agricultural districts of such a journal as therein proposed, the undersigned do not hesitate to state that from the standing reputation and success of its publishers, (Messrs. Dewey & Co., proprietors of the **SCIENTIFIC PRESS**), we believe the new journal will be worthy of universal trial by our agricultural and rural population, and that its publication will be fruitful of much usefulness to its subscribers and in forwarding the development of our natural wealth and prolific resources.

CHAS. F. REED, President State Agricultural Society, Dr. J. S. CURTIS, Yolo Co.
WM. H. PARKS, late Pres. North Dist. Ag. Society.
ROBT BECK, Sec'y Cal. State Agricultural Society.
C. T. WHEELER, Member State Board of Agriculture.
ROBT HAMILTON, member St. Board of Agriculture.
E. MILLS, Member State Board of Agriculture.
I. N. HOAG, late Sec'y State Agricultural Society.
O. C. WHEELER, formerly Sec. State Agricultural Soc.
G. N. SWEZY, Pres. North Dist. Ag. Society of Cal.
J. E. DOVE, Pres. San Joaquin Agricultural Society.
ROBT WATT, State Controller.
JOHN BIDWELL, formerly Pres. Upper-Sacramento Ag. Society.
EZRA S. CARR, Prof. of Agriculture and Ag. Chem., Cal. State University.
E. J. HOLDEN, formerly Pres. San Joaquin Ag. Society.
HARMEN BAY, Pres. Upper-Sacramento Ag. Society.
E. HALLET, Secy. Upper Sac. Ag. Society.
R. B. SWAIN, Pres. Chamber of Commerce, S. F.

A. S. HALLIDIE, Mechanics' Institute of the city of S. F.
HENRY KIMBALL, Pres. Odd Fellows Library, As'n S. F.

SCIENTIFIC AND RURAL PRESS.—L. P. McCarty, traveling and corresponding agent for the "Scientific" and "Rural Press," papers published by Dewey & Co., San Francisco, was in town this week soliciting subscriptions. Miners and farmers can get more information from these journals in relation to their special vocations than from any other publications now being issued in the State. The "Rural" was commenced with the year and promises to become a very popular agricultural paper, having already gained an extensive circulation.—[Sonora Democrat.]

RURAL PRESS.—L. P. McCarty, traveling agent for the San Francisco "Rural Press," is now in this town soliciting subscribers and collecting statistics and other information for the paper. The "Rural" is a large, well-conducted paper, containing a great variety of important information to the farmer, gardener, mechanic, or merchant, and we are pleased to see that it is attaining a large circulation throughout the State.—[San Joaquin Argus, Snelling.]

The "Scientific Press," of San Francisco, is a journal that is in full sympathy and action with the progress of the age; while it notices all the late scientific discoveries and improvements, it does not neglect "the weightier matters of the law," the wonderful agricultural, mechanical, mining, and railroad progress at this time in our great and enterprising Pacific States.—[N. Y. World.]

NEW PUBLICATION.—The "Pacific Rural Press" is devoted to the agricultural interests of the State, and from the extensive and reliable means of acquiring information possessed by Dewey & Co., through their correspondents, we have no doubt this paper will be, as its first number promises, a desirable acquisition to the farming public.—[Lower Lake Bulletin.]

ALKALINE SOILS.—We have not seen the last number of the "PACIFIC RURAL PRESS" but learn from the Sacramento "Union" that that journal has a very instructive article on the various methods of relieving alkaline soils from the superabundance of salts which they contain.—[Daily Enterprise, Virginia, Nev.]

PACIFIC RURAL PRESS.—The paper will be quarto in form, and contain in each issue sixty-four columns of matter, and be devoted principally to agricultural and horticultural matters. The subscription is \$4 per annum; clubs often \$3. Address Dewey & Co., 414 Clay street, San Francisco.—[Placer Herald.]

NEW PAPER.—The "Pacific Rural," published by Dewey & Co., in San Francisco, is devoted to agriculture, and fills a void long felt in its department of literature on the Pacific Coast. We wish it success. It should be on the table of every farmer and mechanic in California.—

THE **RURAL** is an excellent paper for the farmers and orchardists of California, and of this fact they will be convinced by an examination of the paper.—[Grass Valley Union.]

SCIENTIFIC PRESS.—This excellent journal, published at San Francisco, entered upon its 22d volume last Saturday. It should be well supported by the miners and mechanics of the State.—[Amador Dispatch]

What our Neighbors say of the Pacific Rural Press.

It is a beautiful and valuable sheet.—[San Jose Ind.]
The first No. evinces marked editorial ability. Fills up a vacancy that has been felt in our agricultural department. With its publishers there is no such word as fail.—[Mt. Messenger.]

We believe every subscriber will be satisfied with the investment of the price of subscription, \$4.—[Sonora Dem.]
It is a work which no farmer should be without.—[Frederick Union.]

An admirable specimen both as to execution and contents. Contains a large amount and great variety of attractive reading matter and several excellent illustrations.—[Stockton Daily Ind.]

A large 16-page weekly. The **Rural Press** will be to the Pacific coast what Moore's **Rural New Yorker** is to the Middle and Northern States.—[Encinal Alameda.]

Any intelligent farmer in the State will consider his money well invested by subscribing for the new paper. "Honest, intelligent and correct information will be faithfully given in behalf of and urging an improved cultivation of the soil, a greater diversity of products, better breeds of stock, better varieties of fruits, the culture of new products, the creation of new home industries, the adoption of improved implements, and happier and higher aims in life."—[Euclinal.]

They can, if they will, make it a creditable work. [We will that.] It opens well.

Excellent paper and type—and a first-class agricultural journal. Its merits entitle it to a large circulation, which we apprehend it will speedily obtain.—[Vallejo Recorder.]

We announce with pleasure the new paper by Dewey & Co., proprietors of that peerless paper, the **Scientific Press**.—[Arizona Miner.]

We think the rural people of the Pacific Coast will have an organ second to none in the country.—[Idaho Statesman.]

Just the kind needed on this coast, and merits an extended circulation.—[Red Bluff Independent.]

PACIFIC RURAL PRESS, published by A. T. Dewey, W. B. Lwer, G. H. Strong and J. L. Boone. The paper is a success, and will supply a want long needed.

It has already attained to a large circulation. Is running over with entertaining and instructive reading matter, and embellished with numerous engravings. The heading is beautiful and appropriate.—[Pajaronian.]

We cordially welcome it. The publishers, believing that the agricultural enterprises of this coast were sufficient to support a publication wholly devoted to its interests, determined to confine the **Scientific Press** to mining and mechanical arts, and have therefore started the **Pacific Rural Press**.

If the first number is to be taken as an earnest of what will follow, each week, we can advise you to all interested in agricultural pursuits. subscribe.—[Vallejo Chronicle.]

Dewey & Co., publishers, have unusual facilities for publishing a superior paper for the farming community, and they are men of energy to do it.—[Evangel, S. F.]

Such a paper has been in demand on this coast for some time, and we judge from the amount of agricultural information which it contains, that it fills the bill.

We notice that I. N. Hoag, of Yolo county, has been selected as one of the contributors to its pages.
It is the duty of the farmers to sustain it, and try and make it a success, which we believe will be done.—[Yolo Mail.]

We have received this new home and farm journal, and like it well.

The publishers seem determined to make a popular, first-class rural home journal, well filled with interesting and elevating reading, with no unchasteness in either reading or advertising matter.

Having the countenance and encouragement of the prominent and most active agriculturists in California, and long experience in the publication of the "Scientific Press"—which will be continued entirely independent of the "Rural Press"—the public have ample assurance that the new effort to establish a first-class farm journal on this coast will prove a success.

Dewey & Co., San Francisco, are the publishers, and the price is low—\$4 a year; or to a club of 10 or more, \$3. Sample copies sent on receipt of a postage stamp.—[Alpine Miner.]

The "Rural Press" will supply a want long felt in California, and we predict that it will acquire a large circulation among our agricultural population.

Unlike many so-called "agricultural" papers, it will not be exclusively devoted to horse-racing, prize-fighting, yachting, etc., but will be a respectable family journal.—[Democrat, Downieville.]

We judge that it will meet the requirements of agriculturists. As publishers of the "Scientific Press," the name of Dewey & Co. is a guarantee that this new publication will meet with favor.—[Alpine Chronicle.]

The farmer, horticulturist, the home circle and the housewife will find in it just the articles that will be pleasing and profitable to them.—[Christian Advocate, S. F.]

It will represent the agricultural interests of California and the Pacific Slope. With so much ability as to command a wide circulation and influence.—[Helena, (M. T.) Goz.]

Will be found worthy the patronage of the people of this State.—[Argus, Snelling.]

We heartily welcome the new publication. The interests of our own county are about equally divided between mining and farming.

Not a farmer in it, however well informed, but may learn something of value pertaining to his business, from an ably conducted paper, specially devoted to the consideration of the peculiar conditions of soil, climate and seasons of the Pacific Coast.

From the well known ability and energy of the publishers, we doubt not that the "Rural Press" will fulfill all these conditions.—[Inyo Independent.]

FROM A CORRESPONDENT.—I have seen your "Pacific Rural," and I never tire of looking at and studying its "head and front." It is a *taking* picture, and will induce many to take the paper. The contents are No. 1, also. W. H. M.

Send in your subscriptions at once to Dewey & Co., publishers, No. 414 Clay street, San Francisco.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the **SCIENTIFIC PRESS**. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. **ADVISE AND CIRCULARS FREE.** Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. ENGRAVING ON WOOD, of every kind, for illustrating machinery, buildings, trade circulars, labels, plain or in color, designed and cut in the best style of the art by experts in our own office. Also, engraving on metals.

SCIENTIFIC PRESS.

FOR 1871.

WILL BE SPECIALLY DEVOTED TO

Mining, Mechanic Arts, Inventions, and Home Industries of the Pacific States.

PRINTED ON NEW TYPE.

AND ITS

READING COLUMNS INCREASED,

AND

Otherwise Improved in Value.

The success of our improvements in 1870, and the reduction of our subscription rates to \$4 per annum, resulting in a large increase of subscriptions, has induced us to make the above announcement.

CLUBS AT \$3 PER ANNUM

For each name, will be received when ten or more persons co-operate in sending in their cash in advance. Don't hesitate. Forward your own individual subscription. No one knows the real value of the **PRESS** until they read it. Use your copy of the paper to induce others to subscribe, (if you like it yourself), and in subsequent remittance for a club, we will allow you the difference first paid above club rates.

DEWEY & Co., Publishers.

ENGRAVING ON WOOD

Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, etc., etc. Prompt execution and reasonable prices.

DEWEY & Co.,

No. 414 Clay street, S. F.

NEW AGRICULTURAL PAPER.—No. 5 of the "Pacific Rural Press" came to hand this week, fully sustaining its former issues, and "speaking great credit" for the proprietors who have fairly established the "best" agricultural paper on this coast. The editorials are written by an experienced hand, and can, therefore, be relied upon as correct. The subject matter each number contains is worth more than the price of subscription. We hail this advent in the agricultural field, and bespeak for the proprietors success in their enterprise, as the State and Coast has now a paper "fully up to the occasion," and one which cannot fail to become valuable and interesting. Price per year—\$4 00. We especially commend this new agricultural journal to our friends in Sierra Valley, not only as a repository of useful information, but also as a beautiful pictorial for their parlor tables.—[Mt. Messenger, Downieville.]

NEWSPAPERS.—The San Francisco "Scientific Press," a journal that has accomplished more for the miners of this coast than all the professors and mining sharps from New Mexico to Dakota, has completed its 21st volume, and promises to continue its good work of instructing miners, mill-men and others, and making known the mineral resources of the mining States and Territories. The "Press" has the best wishes of one Arizona "Miner," for long life and great prosperity. Its enterprising publishers, Dewey & Co., have just issued the first (sample) number of their new agricultural paper, "The Pacific Rural Press," which promises to be as useful to farmers, gardeners, etc., as their other "Press" has been to miners.—[Arizona Miner]

YES, GIVE IT A TRIAL. This new publication is the best agricultural paper on the Pacific Coast. Our farmers will find it a valuable companion. It is issued by the publishers of the **Scientific Press**.—[Santa Cruz Times.]

A Pacific States Illustrated Home Journal.
